FROM SALAMANDER SOFTWARE**

TURTLE GRAPHICS

This program has been designed to provide a method of drawing pictures with your Computer which is both fun and educational, and yet simple enough to be enjoyed by the young or inexperienced computer user and the professional alike.

Pictures are drawn by telling the "turtle" to move forward and how so that it traces a picture on your TV screen or a colour printer plotter.

Powerful "repeat" and "word library" facilities allow you to build up the instructions to your progress, and you can save your "word library" on cassette tape or floppy disk.

The end result of using a system such as this is an increased knowledge of geometry, and a better understanding of simple programming, and so this program is an ideal educational tool for all ages.

- Simple 32 page manual included
- Runs from cassette or disc (using either Dragon Data DDS or Premier Microsystems DDS)

- Simple command structure
- Repeat command sequences - can be nested to 32 levels
- "Word" definitions - can be nested to 32 levels

- Powerful "word library" handling
- Save and load library using cassette or disc

- Automatic saving of command strings and word library
- Scaling and stretching commands
- Will draw pictures on a colour printer plotter (TPE-BL CDR115, MCP-40, or compatible printer)

Price
£9.95

DATA RETRIEVAL SYSTEM

DR5 is a powerful database package for the Dragon computer, supporting files stored either on cassette or disc (using the Dragon Data DDS).

DR5 has been designed for ease of use and flexibility. You can design your own database, specifying number and type of fields. Powerful full screen editor allows easy design of your own screens.

DR5 contains full facilities for adding, maintaining and deleting records. Fields may be added to or deleted from existing files even after records have been added. Search facilities allow for selection of records by any portion or combination of fields.

DR5 includes an extremely flexible report generator, allowing for anything from printing of labels to pagged reports.

- 22,000 characters of data per file
- 154,000 characters of data per alter file
- Each record may contain a maximum of 480 characters, 20 alphanumeric fields and 16 numeric fields
- Recursive structure and nested arrays on alphanumeric fields
- Comparative searches on numeric fields
- Add, delete and change records
- User definable screen displays
- User definable report generator
- Record formats may be changed at any time
- Disc files require Dragon Data DDS

How to submit articles

The quality of the material we can publish in
Dragon (for each month will, to a very great
extent, depend on the quality of the
contributions that you can make with your
Dragon. The Dragon 32 computer was launched
on to the market with a powerful version of
Basic, but with very poor documentation.

Every user of an early user's Dragon will be
able to discover new tricks and quips almost
every day. To keep other Dragon users keep
up with the speed of the development work
of us must assume that we made the
discovery first — that means writing it down
and passing it on to others.

Articles which are submitted to Dragon
User for publication should not be more than
2000 words long. All submissions should be
typed, double spaced with margins, and a
double space between each line. Programs
should, wherever possible, be computer
printed on plain white paper and be accom-
panied by a tape of the program.

We cannot guarantee to return every
submitted article or program, so please keep a
copy. If you want to have your program
returned you must include a stamped,
addressed envelope.

Dragon talk	25		
Do Welsh-speaking Dragons really exist or is it the machine code mutants that they've acquired?			

Editorial

"THE ENTRANCE FROM the wings of GEC was not entirely unexpected" was our comment last October when Brian Moore, formerly deputy managing director of a GEC subsidiary, took over the running of Dragon Data. So it was no more of a surprise when the electronics giant moved further into the spotlight earlier this year.

It was announced that sales and marketing of all Dragon Data products had been taken over by another GEC subsidiary, GEC McMichael (this is one way to tell you're dealing with a giant company, when you find it's got subsidiaries everywhere). GEC now has a finger in a lot of computer pies, ranging from such things as specialised chip manufacture to videodata. It's not clear at this stage exactly what GEC's grand strategy is, but it certainly has enough cash to support any moves it takes to make. And it's also prepared to play a waiting game. Early last summer GEC was involved in talks with another British micro manufacturer, Torch. These talks came to nothing, and only now has the company's interest in the micro market been publicly revived.

However, GEC has missed one chance to invest in Dragon Data. Toy-maker Mattel, formerly a shareholder in Dragon Data and the founder of Dragon computers, went into receivership at the end of last October — nearly a year after selling Dragon Data off to a consortium of investors. This meant that Mattel's shares were up for grabs, with the other shareholders having first refusal. At the same time as news of the GEC marketing deal broke, it was announced that existing shareholders had taken over Mattel's holdings. So one string with the Dragon's past was finally broken, as the GEC strand continued to unravel. The main shareholder in Dragon Data is in fact Protels, the high-technology investment division of Prudential Assurance, itself a shareholder in GEC.

What this manoeuvring means for Dragon users is hard to say. GEC's marketing influence seems more likely to benefit Dragon Data's move into the business market — how much about the electronics giant can bring to bear on the home computer market remains to be seen. Intriguing, too, is how "intensive" the relationship between the two companies will be. Obviously Dragon Data will be concentrating on developing products. GEC is keen to market — so is this way GEC will be playing some role in deciding Dragon Data's direction. Of course there are two sides to being involved with a giant too. GEC, its very size suggests that it will be, on the one hand, lumbering, but on the other, stable. The last seems a little inappropriate for the home computer market but the second does have advantages for users — for example, Microsoft's interest in providing a Dragon service has been encouraged by GEC's arrival. And GEC has a reputation for avoiding many of the problems of sheer size by allowing its subsidiaries a great deal of independence.

Oasis Software present...

The first basic compiler for the DRAGON 32

SPRINT BASIC COMPILER by Dr. David Gray FOR THE DRAGON 32

Sprint compiler is a subset of standard Dragon BASIC which covers arrays, strings, GOTO, GOSUB, GOSUBRETURN, virtual-keyboard, screen, floating point arithmetic and associated commands. All arithmetic is integer and the Dragon sound/diagnostic commands are fully supported.

The technique used is based on the approach used in BASIC 3.0. Pascal where the Basic program is first produced to intermediate code and this is then executed using a run time package which is saved with the rest of the compiled program.

- Programs will run 5-10 times faster.
- Almost the entire Basic is supported, with the exception of floating point commands.
- Code produced will run independently of the compiler (for potential authors).
- Programs are compiled from tape under remote control so that much larger programs can be compiled.
- Sprint is designed for ease of use and a comprehensive manual is included.
- Free demonstration program with each program bought to illustrate the full power of the Compiler.
- All Oasis products are covered by a Lifetime Guarantee.

JUST RELEASED

DRAGON PASCAL £14.95

Dragon Pascal is an extended integer subset of the structured programming language Pascal. A list of its many features include:-

- A complete set of structured programming constructs.
- IF, THEN, ELSE, WHILE, DO, CASE, ON.
- COMMENTS, GOTO and SOURCE simultaneously present for a rapid development cycle and final ease of use.
- Very rapid compilation. Source can actually be compiled more rapidly than it can be typed.
- Fully recursive.
- Supplied complete with sample programs including routines which demonstrate techniques for simulating floating point functions such as SIN, COS, LOG, EXP.

GEC selling Dragons

NEW RECORDS and peripherals are on the way from Dragon Data following the news that GEC Multimedia has taken over its UK sales and marketing.

Few details of the products are available, but plans include joint sourcing on a range of peripherals, with some appearing this summer.

The new records, up range to the 64 and running 68k, should arrive earlier — with one or possibly two being in the shops by the end of this April.

"Help's riding to the rescue!"

Micro drives on the way

MICRO DRIVES with a megabyte of memory are on their way from Premier Memory stores.

Single "bare" versions of the 2½ inch floppy drives are already available at just over £200. The dual packaged version, with a megabyte of memory (unformatted), will sell for under £300 — including Premier's disk sparing system Data.

The diskettes themselves cost about £50 for 10 but, as Premier's prices featured points out, they are "virtually indestructible".

All Premier's disk software will be available — covering business, utilities, games and education.

Micronet is set for a spring launch

THE LONG-WAITED tele-software service for Dragon users is due to arrive soon from Micronet 660.

BBC and Spectrum users already have access to Micronet, which says that it is planning "to offer software for the Dragon 32bit this spring".

Two modems will be available — the 1000 at £59.95

and the more software controllable 2000 at £84.95. Additional communications software will bring the price up to nearer the £100 mark. Other modems can be used — write to Micronet for details.

Other costs include a subscription charge of £13 a quarter (£8 for Micronet, £5 for Prestel), a connection charge

of 5p a minute in peak hours, and the cost of the telephone call.

In return you get access to a range of free software, more news, electronic mail facilities, Swapshop and Clubnet — plus the chance to play the interactive game Starnet.

With Micronet you also have access to the rest of Prestel.

All the fun at the fair

THE news from the Leisure Electronics Trader show, held recently at London's Heathrow Plaza Hotel, was good for Dragon users.

The show, first of its kind, was a trade only exhibition for the home computer industry. Over 150 exhibitors gathered together to display their latest selling and up-and-coming products and software titles.

Of interest to Dragon software buffs are new titles from Salamander, Shards and Sulu.

Following on from its January releases, Salamander has scheduled March as the date to launch *The White Cliffs of Dover* (price £7.95) as a sequel to *Wings of War*. Having parachuted into France and found a chateau somewhere deep in enemy occupied territory, you now have to make good your escape and reach the safety of "good old Blighty".

And if it's more sequels that you're after, Dan Diamond in *Franklin's Wonderland* (£9.95) is back. Fresh from the adventures of his original trilogy, he is ready to embark on the first of a whole new second trilogy.

Also being released are *Feed Meeter*, a 3D maze game in the Pacman tradition, and *Eagle*, a non-violent machine-code arcade game originally available for the BBC micro.

From the people at Shards comes a four part educational adventure, a sound utility and a real life simulation game for adults.

Mystery of the Java Sea (£7.95) uses over 100K of

Beyond Software's show stallers at LET

memory as you journey from Bristol to London and on to the Caribbean in search of a sunken treasure ship. With three levels of difficulty and three different scenarios, this is billed by Shards as an ideal mystery adventure for the whole family.

Shaper (£3.95) is a sound utility program, plus manual, which enables you to create a sound from scratch or alter and build on existing sounds by changing one or more of the given variables.

Hotn Sea Oil (£3.75) is an adult financial game written by an offshore engineer. Acting as offshore installation manager, you have to run the oil rig and generate a profit of \$100 million.

Sulu Software also has three new releases out now for the Dragon 32, and is planning to release two large programs for the 64.

The programs are all educationally oriented. *Basisset* is a game to test your vocabulary and spelling. To move a knight over the castle bridge the user has to identify a word from its definition or clue and spell it correctly. For example definition — bring back to life, juri-

bled clue — uscthrasaeu plus distractors, word — resuscitate.

The castle is saved when the user succeeds in spelling a series of words correctly; and is conquered when three mistakes are made, allowing the infants to mount the castle steps.

Following on in this vein are *Wordpower*, a game to help you improve and expand on your use of English, and *Just a Jolt*, which helps you perfect *Franglais*. Five hundred French words with their English equivalents are given. All three programs cost £9.95 each.

On the negative side of things, Richard Shepherd has no plans at the moment to convert further programs to the Dragon. Transylvanian Topsy has sold well according to Richard Shepherd, but not well enough to encourage further conversions.

However, Cuckoo's is looking into the possibility of converting some of its successful programs. And Griffin and George, the educational software people, are considering creating programs for the Dragon 64.

1970s and 1980s, the number of people in the United States who are employed in the service sector has increased from 30 to 40 percent of the total workforce. This increase has been driven by a number of factors, including the growth of the service sector, the decline of manufacturing, and the increasing demand for services. The service sector is now the largest sector of the U.S. economy, and it is expected to continue to grow in the future.

Cost-effective
business software
for home computers

OPERATION GREMLIN . . .

A very different game that combines the intrigue of adventure with the real time, machine code speed of arcade action. The player must control not one, but EIGHT different troopers, each with their own character status, in the search for the weapons that will destroy THE GREMLINS.

DRAGON TREK

Dragon Trek is a new implementation of a classic game, taking full advantage of the Dragons hi-res graphics and sound capabilities. Your starship's impressive armament is comprised of high energy Photon Torpedoes and Phasers. Both long and short range scanners (in full graphics) enable you to track the Klingons and your onboard computer will give you extra tactical facilities. As commander you will have to use strategy and cunning to defeat the enemy.

THE RING OF DARKNESS

BRITAIN'S No. 1 ADVENTURE GAME! FOR THE DRAGON 32 IS NOW AVAILABLE FOR THE BBC SPECTRUM AND ORIC

THE RING OF DARKNESS is a complete role playing adventure in hi-res graphics, featuring a detailed land filled with towns, 3D dungeons, forests and seas, and populated by kings, princesses, evil rangers and other strange creatures. All versions are identical with respect to the adventure. The Oric version is recorded in fast mode only. Many hours of mystery and suspense await you in your quest to find The Ring Of Darkness.

Get on board to learn about interfacing

IF YOU want to learn more about microprocessor control and logic design, or are looking for a process control instrument, Electrosynthetic Technology may have the answer.

Its interface board comes in

a kit for £40 including manual and plugs into the Dragon's cartridge port.

The interface includes a 6821 peripheral interface adaptor chip, analogue to digital converter, digital to analogue converter, and 16-bit LED display.

Applications include data acquisition and process control, although the board has been designed to be "as versatile as possible". Applications notes and ideas for development are also included.

Electrosynthetic Technology can be contacted at 8 Avenue Road, West Derby, Liverpool L12 4RN.

Users' club moves along south coast

THE DRAGON Users' Club in Warrham has outgrown its former home at Games and Computers and moved along the coast to Bournemouth.

The club is now being run by Computerhouse UK, Alan Monaghan, who is moving with the club, explained that the way "things grew" and the time it takes a new company "to pick up the reins" had led to some administrative problems.

Computerhouse UK promises to meet any unfilled orders as soon as possible.

Any queries on outstanding orders should be addressed to the company at 9 Norwich Road, Bournemouth, Dorset — or telephone (0202) 354116 from the beginning of April.

Alan also promises that refunds will be offered to users who are not satisfied with the service.

He added that the cassette-based magazine *Dragonwings* had had some problems, partly with missing audio, machine code and Basic programs. But Computerhouse UK was "now on the verge of getting it right".

Going on the air with the Dragon

DRAGON-COMPATIBLE broadcasts are on their way from the Radio 4 Chip Shop programme — and amateur radio fans already have their own network to tune into.

Chip Shop producer Trevor Taylor explained that the Dragon transmitter was "within days of being ready". However, listeners should wait until the service is announced on the air before sending off any money.

Chip Shop started regular broadcasting in the middle of January. Its initial run ended on the 17th March but summer specials are planned and "normal service" will be resumed on the 15th September.

The Chip Shop programme itself went out on Saturdays at 9 pm. Its Takeaway Service of software tips (broadcast) on four nights a week at 23 minutes past midnight — just after the shipping service.

The Takeaway service is broadcast in Basiccode 2. A cassette with programs converting this to machines such as the BBC B and the Commodore 64 is already available — at £3.95 including a hand-book.

Once the Dragon version is added users will be able to run both Takeaway broadcasts and any other programs recorded in Basiccode 2 on other machines.

The place on the dial to find Chip Shop is 100 kilohertz long wave. It also goes out on VHF and the medium wave — frequencies vary from area to area so check in the Radio Times.

Amateur radio fans should turn to 144025 megahertz to join Dragon (on Sunday mornings). The first Dragon took place on the 1st January from 11.30 to 12.00. The next now starts at 11.00 but organiser P. A. Davis says that "even an hour is hardly enough".

Again, from participants in the net there is a wide range of listeners. Stations join in from Leicester, Loughborough, Nottingham, Huddersfield and Worcester. And most can be heard over a radius of 50 miles.

Some participants are looking at new ways to allow Dragon to Dragon link-ups on the air and the organiser promises "no doubt we shall soon be enjoying the fruits of their labours".

Flex promises portability

FLEX has arrived for the Dragon 64 — in a version which promises portability between rival disk systems as well as rival machines.

London-based software house Compuserve has licensed Flex from the US firm TSC. Compuserve itself is selling Flex for Dragon Data type disks and has authorised other firms to sell versions for other systems.

Premier Microsystems is selling a version for its disk operating system while Cambridge Microprocessor Systems will be selling a version for the BBC B.

Ted Opychral at Compuserve points out that this means there will be "portability in applications software across machines and across systems".

The range of software avail-

Compuserve's Ted and Ted Opychral — selling Flex machines, C68.

Dragon Data itself is marketing C68 (reviewed in this issue) which is a multi-user, multi-tasking system. Flex, on the other hand, is aimed more at single users

turning a single machine. As such, Ted argues, "it's by far the easiest to run".

Help for Basic programmers has also arrived from Compuserve in the shape of three new pieces of software — Dynaflex, Dynamiser and Dynaxref.

Dynaflex is a Basic compiler said to make programs up to 10 times faster. It does this partly by exploiting the internal 16 bit capabilities of the 68000 chip.

Dynamiser combines lines and strips redundant items such as FOR statements from programs.

Dynaxref is available on cassette, as is the cross-reference utility Dynaxref. Both are included with Dynaflex itself which is available on cartridge or disk (Dragon Data version).

EDIT+

EDIT+ is a Full Screen Editor and Programmer's Tool Kit. It is an excellent aid for writing programs in BASIC and is easy to use for the novice as well as the experienced programmer. EDIT+ includes all the facilities of HI-RES. Up to 23 lines of your program are displayed on the screen and can be changed by overtyping, inserting, or deleting characters. Functions include: Find String, Change String, Copy Text, Goto Specified Line, Scroll Up/Down, Append From Tape and Enter Basic Command. No Dragon is complete without an EDIT+ **£24.95**

HI-RES

Plug the HI-RES cartridge into your DRAGON and you will immediately see the improvement. The screen displays 24 rows of 56 characters with proper upper case and BASIC works as normal but with extra features: Selectable character sets (English, French, German, Danish, Swedish, Italian, Spanish), SPRIE Graphics, Redefinable Characters, Improved keyboard action with autopoint allows faster typing. Graphics and text can be moved on the screen. Suitable for educational and business use. **£25.10**

SOURCE TAPES

The following programmes contain both source and object code. They can be used in conjunction with DASM or on their own as individual programs. It's a great way to build up your software library. Each tape represents excellent value at only **£5.99** each.

1. DISASSEMBLER
2. GAME OF LIFE
3. HI-RES SCREEN DUMP FOR EPSON
4. HI-RES SCREEN DUMP FOR SIOGARA

EXTRAS

QUICK COVER **inc p4p £2.99**
 PRINTER LEAD **inc p4p £14.99**
 MONITOR/SOUND LEAD **inc p4p £3.99**
 Super responsive 14 inch Colour Monitor with integral sound deal for DRAGON and most other applications **only £229.00**
 DRAGON DISC DRIVE complete **inc p4p £269.00**

DASM

DASM is a versatile assembler, designed especially for ease of use on the DRAGON and allows you to assemble machine code while still retaining the full use of BASIC. Supports all GBI/O instructions and modes. Allows any length for labels (the first 5 and the last characters are used). Full support for output to printer. Recommended for the beginner. **£18.95**

DEMON

A powerful machine code monitor which allows you to delve into the internals of your DRAGON as well as helping you to debug your machine code programs (and BASIC programs using PEEK and POKE). Includes: Examine/Change memory, Examine/Change registers, Print Screen, Set Breakpoints, Test Memory. An essential tool for all machine code users. **£18.95**

DASM/DEMON

It has all the features of both DASM and DEMON in one package. DEMON is the natural partner to DASM, complementing each other perfectly. Write, test and use your programmes without the bother of HiLoading. It is extensively featured in the new book by Ian Sinclair on Dragon Machine Code. It is the ideal combination for the machine code user. **£20.45**

BUSINESS SOFTWARE

The following MST programs are now available for use on cassette with the HI-RES 56 by 24 Screen: Database, Business Accounts, Stock Control, Invoices/Statements, Mailer/Address Book.
 Also available: Home Accounts, MST Calc. **£19.95**

BOOKS

Books and Extras
 Introducing Dragon Machine Code by Ian Sinclair **£7.95**

DYNAFAST

NEW!
 SPEED UP!
 Complex any working BASIC program into superbly machine code. Write & test programs as usual then compile with DYNAFAST to achieve maximum time saving during operation.
 DYNAFAST - BASIC COMPILER **£19.95** **CART £29.95**
 SPECIAL INTRO. OFFER INCLUDES DYNAMISER & DYNAMREF

DYNAMISER

NEW!
 MAKE ROOM!
 DYNAMISER OPTIMISES YOUR BASIC PROGRAM BY ...

- 1) removing redundant space and characters
 - 2) deleting unnecessary REMS
 - 3) combining several lines into one line
- Save space, protect your program and speed it up!
 DYNAMISER - BASIC COMPILER **£9.95**
 inc. TAPE OR DISK

DYNAXREF

NEW!
 ANALYSER
 DYNAXREF analyses a basic program and displays all references to variables & labels within the program. Now that you can tell where your program is updating variables it's easier to correct errors!
 DYNAXREF - BASIC CROSS REFERENCE **£5.99** TAPE OR DISK

DYNAFIX

- NEW!**
- full screen display & edit of sectors by file name or sector number
 - full screen display & edit of memory
 - printer dump
 - string search routine
 - copy disk to tape, tape to disk
 - disassemble from disk
 - list BASIC programs
 - menu driven

DYNAFIX - DISK FIXER **£24.95**
 DASM/DEMON available on disk **£19.95**
 HI-RES EDIT+ available on disk **£24.00**
 - upgrades available from cartridge

Please write for details

GRAPH DRAWER

For HI-RES or EDIT+, draws bar charts, direct to screen and printer. Print module for Epson MX or FX printer included.
 Introductory offer of £10.95 if purchased with HI-RES or EDIT+. **£29.95**

Features include:

- 255 MAXIMUM NO. OF ROWS
- 255 MAXIMUM NO. OF COLUMNS
- VERY EASY TO USE
- INDIVIDUAL CELL FORMULAE
- COPY BLOCKS OF CELLS
- COMPATIBLE WITH ALL PRINTERS
- EASY 132 COLUMN PAGE WIDTH
- GRAPH FORMAT FOR BAR CHARTS
- COMPREHENSIVE MANUAL INCLUDED
- INTERNATIONAL USER GROUP
- SORT ROUTINE IN ASCENDING OR DESCENDING ORDER
- Single character commands
- Help display
- Enter text or formulae 255 characters long
- Repeat last entries
- Available memory always displayed
- Page entry modes for text and data
- Selectable automatic cursor movement
- Insert/Delete, Move entries row or column
- Replicate one cell to fill row or column with selectable adjustment
- All machine languages for loading speed
- 104K data storage space available in 32K systems
- Basic style formulas
- Arithmetic operators +, -, *, /, %, =
- Relational operators =, <, >, <=, >=, <>, <=, >=, <>
- Logical operators AND, OR, NOT
- Conditional formulas IF... THEN... ELSE
- Trig functions SIN, COS, TAN, ATN
- Log functions LOG, EXP, LOG
- Misc. functions INT, FIX, ABS, SIGN
- Range functions: SUM, AVERAGE, COUNT, MIN, MAX, LOOKUP
- Nine digit precision
- User definable constant table
- User definable printer set-up commands
- Individual column width settings (1 to 255)
- Adjustable row height to meet blank lines without wasting memory
- Hide columns or rows
- Alternate print form selectable cell by cell
- Display/Print format set by cell row or column
- Format, column grouping, prefix or postfix signs
- Scientific notation, fixed point and integer formats
- Left/Right cell contents justification
- Full page formatting
- Alternately stored with worksheet on discette
- Saved discette files in compact memory form
- Screen size definitions
- Copy/ASCII file for wordprocessor input compatibility
- Memory resident code... no repeated disc calls

ELITE *

CALC

NOW... The worksheet calculator program you've been waiting for is waiting to work for you. ELITE*CALC is a powerful, full featured spreadsheet for the Dragon 32/64 and Tandy Color Computer. Answer 'what if...' questions, prepare reports and cash flow projections, maintain records and perform other tasks which, until now, required sophisticated business computers. ELITE*CALC is a serious tool for those who want to do more than play games on their micro.

Available from stock on cartridge for the Dragon 32 or 64 or Tandy Color Computer... please specify. Shortly available on disc for the Dragon Data or Comshare/Premier or Radio Shack systems. Also available in the 8-format instead of the G-format if requested.

THE BEST FOR ONLY

£45

Elite*Calc has had excellent reviews in the American press and an enthusiastic reception at the recent International Rainbowfest.

*"Elite*Calc is a great spreadsheet program"*

TANDY COLOR COMPUTER

Software scrutiny

John Sorkens takes his software chances

AS I BEGAN to look through this month's collection I thought I was in for a trip through the New Arcadia. Unfortunately, as I discovered after an evening's exploration, the new games that appear in arcades haven't yet reached the Dragon, and many of the programs are rehashed versions of ones that have been on the market for a long time. I realised I should have kept my mouth shut about "yet another invaders tale", as that's just what I found ticking at the bottom of the Jiffy bag. (I think it was planted secretly by the editor to test my sanity!)

Last month must have been the first since Dragon User started that I didn't have any new Microdeal programs to review. As I was finishing the last paragraph, an enormous parcel of its latest releases arrived from Cornwall, and these are included in this month's review. As usual, there are great ideas along with some more lightweight offerings, and one or two that are a little suspect.

Brain Bender

After the success of Space Shuttle, Microdeal has acquired a Tom Mix program called **Air Traffic Control**. The display is similar to the radar sets in control towers, and shows two runways that cross each other. Small planes queue up to take off, and others fly across the screen. These are not airlines, but Remotely Piloted Vehicles (RPVs), that can be controlled by you. After selecting a difficulty

level and plugging in the right-hand joystick, the display shows the control screen, which is surrounded by various instruments. There are seven modes of operation that determine how you can control the planes, and the object is to land safely any that fly across the screen as well as launching those waiting to take off.

The joystick allows you to move a tiny square around the screen and pressing the fire button allows you to lock onto the plane you wish to control. Using the joystick to move the cursor up and down, a little menu display allows you to alter the compass heading, the airspeed and the altitude. Although it took some time to get used to the controls, the 12-page instruction manual explains most of the things that are likely to happen. The only irritating thing about it was the statement that you could watch the display until you were ready, and then press reset to start the game. Don't do this, as you lose the program immediately!

I found it was fairly easy to control planes waiting to take off, but the higher levels of difficulty have you controlling a dozen or so planes all waiting to land. Although I prefer flight simulators, this program is quite good at taxing the brain. I'm not sure how accurate a simulation it is, but the near misses are probably close enough to put you off flying to Spain for your holiday next year.

That industrious American programmer, Ken Kalish (author of *Phantom Slayer*,

Escape and many others) has been at work again. In **Garage Banger** you control a small figure who has to collect 10 keys from the ends of five floors of a building (Pasha's Chamber). Using the joystick, you have to avoid such problems as Floating Urns, Radioactive Bats and Floating Eyes. You can fire a laser gun to destroy these menaces, or you can jump and duck the missiles they hurl. Once through this screen, you are faced with the Acid Chamber. This consists of rows of stepping stones and the occasional chest of treasures. Unfortunately, large drops of acid fall on your head and slide from the floor, and there are always the demons...

Better than Bonka?

Although I don't feel it's his best, seeming like a more hectic version of Bonka, this game is hard to beat at the upper levels, and does show some originality.

Devil Assault is yet another game from Ken Kalish. It doesn't have too promising a start, but soon livens up. A horde of angry vampire bats appears, rather similar to the beginning of the arcade game Pagan. After these, however, some rather jolly looking robots descend on you. If you can destroy these, you have to deal with some armoured divisions, each of which is called a "spring". I always thought that was what came between winter and summer in Australia. These springs are nastier than the vampire bats and the robots, as they bounce up from the screen's bottom sol-

"I spit you out of existence. Again, I feel there was something lacking, and it was too much like several other games. In spite of this, it's well written and fast, so if you don't have a similar tape, this one could find a place in your collection.

To boldly go . . .

In the dim and distant past, about eight years ago, a friend of mine who worked for a company whose exact name escapes me (something like B&B, I seem to remember), showed me an intriguing executive game involving the movements of a certain Starship Enterprise. It mimicked the spots of video ping-pong, provided your anti boss didn't notice you playing it, but I'm sure it's long since vanished to that happy place in the state where all old computer games finally go. When you pick up **Space**

Fighters you could imagine that it's another arcade action special from Mirodeal. If you look at the small print on the back of the bulky packaging, you will see that the object of the exercise is to destroy "the aggressive fleet of Krugan Space Cruisers which have overrun the Universe". When you discover further that you are the captain of the starship "Endeavour", and can control warp factor, "photon guided missiles" and "phasers", you begin to realize that this is a thinly disguised version of Star Trek come back to haunt us. Only the names have been changed to protect the innocent (or the guilty).

It's more of a medium speed game rather than the "high-speed" arcade action that the packaging describes and the Krugons, oops, Krugans, seem rather easy to destroy, although when you realise there are in excess of 200 of them, you will understand that your task is not so easy. Ship movement is accomplished by using the right joystick, although the keyboard is necessary to alter your altitude and fire phasers, and this increases the difficulty of the game, as does a docking manoeuvre that has been introduced. Hardly original, but those of you who must boldly go will find this an entertaining version of an old favourite.

I wish I could say the same of the new game **Space Fighters** should be renamed "Krugon's Revenge". If you haven't yet bought insurers for your Dragon, you could buy this version, as it's as good or bad as any other. All stars lie in there, descending about your ears in the time-honoured fashion, and like most Mirodeal games, this is available with black, buff or green backgrounds. No more, please, I promise I'll get next month's review in on time . . . You said

Imagine it was known for its Spectrum software, and last summer I can recall playing its game **Jumping Jack**, six months later in the game of **Leggit**, the small hero returns to try his hand, or maybe his head, on the Dragon. If you haven't seen this game before, you'll soon find that although based on a simple idea, it plays to be quite addictive.

For some reason, **Jumping Jack** has been renamed **Leaping Larry**, although the game in all other respects looks like the Spectrum version. The tiny head-

banger appears at the bottom of the screen with eight levels above him and has to progress to the top by leaping through gaps which move along the different levels in both directions. Should he fall through a gap, he will become unconscious for a few seconds and cannot be moved. The same thing happens if you make him jump when there isn't a gap over his head. Because of his habit of falling everything is right with his head, a better name would have been **Turning Yocco**, especially as Imagine Software comes from Liverpool. If you are nimble-fingered enough, you may reach the top and to face with another scroll of moving gaps. The problem now is that other creatures are out to spoil Larry's fun, increasing in number from one to 20, planes, shotgun-toting hunters and other insects hurt themselves against your friend. A pleasant change from alien chasing, if you can cope with the high frustration level.

Ball. Although it states on the packaging that it's in full colour, the clearest screens are seen if you choose a black background. Luckily, the stripes and spots are easy to see, so you don't really need the colours that would be essential in, say, another.

Setting the balls in the triangle is achieved from the keyboard, but subsequent control involves the joystick. This can position the cue, select spin and power of the shot and move the cue onto the ball. The object, as in the billiards game, is to sink all your balls and the eight ball before your opponent can. You continue your turn until you fail to sink a ball of your own colour, or sink the eight ball too early. Computer simulations are superb when they allow you to partake in the impossible or even the mildly dangerous, but that surely doesn't include pool. In spite of the clear displays and ease of playing, I feel most people would prefer the real thing. You also need two people to play the game properly — if you could have played against the computer the program would have had more going.

If you go into almost any pub in the land, from the fashion West End bar to the lowest country pub, the blue-beep and dundun-dun of the video machines in the background remind you that we live in an electronic world. Up until the pings and congs invaded us, the only electrical sounds were those of metallic pinballs clunking their way round the tables. **Pinball** from Mirodeal is an attempt to recreate those long-gone days. I suppose my concerns of **Right Ball** could equally well be applied to **Pinball**. Certainly, the displays are clear, different skill levels are available, sounds are realistic, and the "ball" moves in a very realistic manner. There is little in the way of skill involved in playing the game, however, as the only control is the fire button on the joystick. This controls the speed of the firing bar as well as the flippers. There isn't any of the subtlety of a real pin-table, partly judging it as you play, and there is no dreaded TILT sign telling you that you've gone too far. It's just rather boring watching the ball bounce around the screen and it is difficult not to score highly.

Daring Dan

Hot on the footsteps of **Last in Space**, comes the final part of Salamander's **Dan Diamond Trilogy**, **Fishy Business**. For those of you who missed parts one and two, this technically adventure game concerns the exploits of one Dan Diamond. He is a Los Angeles detective in the 1930s, based rather loosely on Dashiell Hammett's **Dan Speide** and Raymond Chandler's **Philip Marlowe**. In the first episode, **Franklin's Tomb**, Dan Diamond gets a message for help, and ends up exposing a mysterious crypt under a house. After spending some time wandering through the basement, Dan gets desperate and shoots off into Space, where he is lost for the second game. **Fishy Business** uses the same screen format, a description of the present location, a current inventory in

4 and an input area where you can enter the chosen direction.

Perhaps I was thinking more laterally when I played this game, but I seemed to get started a little quicker, and the humour seemed better than in *Lost in Space*. To get into too much detail would spoil the fun (7) of this game, but be prepared for underwater grapplings with Princess Avarose and a location called A Whole Mess of Trouble. If you can cope with red herrings and blue kippers, you will enjoy this game (seriously, I believe, entirely on location in Brighton Aquarium).

Now back to two more arcade specials from Microdeal. *Sixseconds* is very similar to the start of *Devil Assault*, in that there's a horde of angry creatures that whirl about at the top of the screen. They break away and swoop down on you, firing missiles as they come. You start with a protective shield that disappears rapidly under the onslaught; the amount remaining is shown on a scale at the base of the screen. The only novelty in this game is the ability to cancel a missile after it's been fired. All in all, it's an average alien zapping game, with nothing in particular to lift it above a hundred and one others.

Dragon Hawk, also from Microdeal, provides a much more interesting storyline, and although you don't have the chance to change the skill level, it's a more complicated game. The display shows a screen full of flies, small birds, larvae and hawks. You control a little man, Watchful Wilberforce, who runs backwards and forwards along the bottom of the screen avoiding the birds and trying to shoot at the hawks. Before conservationists are up in arms, I should point out that one of the hawks has just carried off your friend, Freaky Freedy Flapper, and is about to drop him from a great height. If you can hit the hawk (and miss Freedy), you can rush to the side of the screen to collect a basket which is used to catch your friend before he tumbles forced into the ground. As you can imagine, the game gets quite hectic, and you learn which things you can shoot and which you should avoid.

Spacefighters galore

The last tape from Microdeal is a version of *Sixseconds*, called with great originality, *Sixseconds*. The screen scrolls from right to left while you fly your spacefighter over a mountainous landscape and through a cave system, avoiding enemy rockets. It is the strange convention in all versions of this game that in order not to run out of fuel, you have to bomb the enemy's fuel dumps. The display is reasonable, showing the landscape, the particular level of the game that you've reached and the number of planes left as well as your score. I found it harder to reach the upper levels, probably as I was using the joystick option which still entails pressing the space bar to drop bombs. In the end I carried Dragon on the floor, and used my big toe for this purpose. I think I prefer Whirlwind Run from Dragon Data to this version, although both have their good points. If you want a copy of this game, it's probably a good idea to look at both.

Air Traffic Control puts you in charge of hilariously Piloted Vehicles

When I saw *Photo-Finish* from Peaksoft, I was afraid I was in for a run-of-the-mill horse racing game, complete with low resolution graphics. The start is certainly similar to other race games, with the opportunity to enter the names of up to four punters, and to bet up to £1000 on six horses. The horses haven't yet run a race, so they have no form, and the first few races are a matter of luck. Where this game really scores is in the quality of the display. The horses are shown in great detail, and the rails scroll across the screen. At the finish, you can choose to see a photograph (actually an enlarged corner of the screen), and the race cards gradually build up a good picture of the form to give you some idea how the bookies select the starting prices. If you enjoy the thrill of the race course, but twice this more than how to select the Daily winner with a pin, then you should find this program instructive as well as fun to play.

Also from Peaksoft is a highly original game designed to warm the hearts of environmentalists everywhere. *Deale* is an arcade game that puts you in the role of an osprey with five hungry chicks to feed. The food is strictly well serviced, and can only be obtained by dive-bombing straight into the

river that passes by your tree and flying home with a fish in your beak. All the while this is happening, you have to protect your nest from poachers who continually attempt to climb the tree. You start with five lives, and if you cannot deliver a fish to the nest within 80 seconds, you lose a life. Although you can fly anywhere in the upper screen, to enter the water you must fly very high, then drop like a stone by pressing the fire button. This is a challenging game, and Peaksoft is to be commended for thinking up a new setting.

Last month I enjoyed playing a naval wargame from Beyond Software called *Up Perspectives*. This complex game involved moving a convoy across an area of sea, and you could choose to be the commander of either the submarine or the surface fleet. *Rivergate* is played on a similar area, but most of it is land and river. It is divided up into many small hexagons, which gives you six possible directions in which to proceed. The cursor keys move the viewing area about, and even though you can never see the whole field of battle, there is a little map on the instruction sheet. This consists of a piece of folded A4 size paper containing all the information you are likely to need (printed in tiny letters,

Although it's beautifully produced in full colour, it's difficult to read, and a booklet would have been useful. The directions are clear, if a little complicated, and you can choose to play against another human or against the computer.

Each army has 15 pieces, comprising four heavy tanks, five light tanks, and six platoons of infantry. It is possible to recruit more men, and you can even lay minefields. It is impossible to give such a complete game the description it deserves; even the time of year plays a part with rain and snow taking their toll. The display is symbolic rather than detailed, but is perfectly adequate for this type of strategy game. Considering the price is only £9.99, this game is well written and makes good use of the screen and displays. Perhaps they'll bring out a more powerful game next time, then they'll satisfy everybody.

When the Dragon first appeared, it had software that was written specifically for it, and apart from a few exceptions, not many programs could be bought in versions for, say, the Spectrum, the BBC and the Dragon. Recently this has changed, and with the growth of software houses, it's probably economic to employ someone simply to convert your best seller to run on

Photo-Finish gives you the excitement of the track

Transylvania Tower: Count Kneeples' tower

Puzzle! showing long-game days

a different computer, or even to struggle with the job yourself. Because people prefer programming on one particular machine, and are able to use its good points and disguise its little foibles, this is not always successful. One software house that has managed to make a satisfactory conversion is Richard Shepherd, which has been writing top-selling maze adventures for the Spectrum for some time.

Transylvania Tower is based on the traditional adventure theme of exploration and treasure collection. It is set entirely in Count Kneeples' tower, a miserable place inhabited by bats. There are five levels, all represented by three-dimensional mazes. At the start you are shown a plan of the maze, and you can come back to this at any time by simply pressing a key. This dungeon level is useful training in maze

running, as there's nothing really to jump on you here. When you finally reach the exit to this level, you are transported to level two, and here is where your problems begin. There are at least 20 bats to be killed before you can reach the next floor. If you reach the transportation point without finding a weapon, you are involved somewhere at random. If you've just discarded your floor plan, this can be very frustrating!

Eventually you confront Count Kneeples, but as every late night TV viewer knows, all you need is a clove of garlic and a silver cross, and even Christopher Lee cowers in the corner. Although this doesn't require enormous dexterity or brain power to solve, the game is fun for all ages, and shouldn't prove too frightening, even with a full moon in the sky.

Stardis Software has been producing interesting programs for some time, and although its early tapes didn't seem to have anything too special, the material produced shows plenty of imagination. Last month it was **Peterson's Diary**, and this month it's **Puzzle!** This game is a computer simulation of one of those plastic games where you move the pieces around a little square frame. In **Puzzle!**, you can choose from three games, with either 12 or 24 pieces, changing colours, and different levels of difficulty. This gives you less time to decide on which of the muddled pieces must be swapped. If you're slow, the computer swaps for you, and the picture becomes even more confused.

You can also choose the picture to be rearranged. There are four choices, a basic flag, a union jack, a lion and a fish tank; this program is excellent in improving memory skills for shapes, and provides a challenging and novel game.

There isn't too much that's completely new this month, but there seems to be quite an assortment to suit all tastes. The programming standard is improving all the time — all that's needed are some fresh ideas. ■

A DATAPLUS OFFER
 THE
TP-1 inc VAT
ONLY £250
DELIVERY FREE

'Dataplot have made their name supplying computer peripherals at competitive prices. I believe that we have now found the best price/performance dot-matrix wheel alternative to dot matrix. The ideal printer for both data and word processing. Truly, a high quality machine at an affordable price. As Managing Director, I guarantee you won't buy better.'

So whatever your computer — BBC, Spectrum[®], Commodore[®], Dragon, Oric, Apple and many others — make the most of it and turn your computer into a quality printing system for home correspondence, documents, short stories and business use.

Use standard stationery or, for **ONLY £79** (if ordered with your TP1) we will supply a tractor feed so you can use continuous or tenfold paper.

This is just one offer you can't miss. To avoid disappointment **RING NOW** on our 24 hour answering service 0242 527412 to place your order quoting your Access/Barcode No., expiry date and full name and address OR complete the coupon below and **POST TODAY**.

Please allow 28 days delivery. If not completely satisfied return goods in original packing within 10 days of receipt and we will replace or refund your money in full.

For technical queries telephone our Expert Hotline 0242 37373 or visit our showroom at 39-49 Roman Road, Chesham.

*BBC and Spectrum Computers require a special interface cable kit. For assistance & price please see 'Technical Notes'.

SPECIFICATIONS

Print Speed: 120 cps
 Character set: 128 ASCII 8 pinwidth
 Character spacing: 10/12
 Printing: bidirectional
 Paper width: 12 inch
 Printing rate: 100/128 character per line
 Line spacing: 8 lines per inch
 Paper Feed: Friction, single sheet or tenfold
 Interface: 50-pin
 Dimensions: (H) 6.4" (W) 11.5" (D) 10.4"
 Weight: 10.5 lbs

Operator Controls: Power switch top of form, impression control 2 levels

INTERFACES

Parallel

Centronics compatible, 7 bit parallel data, 1 control line data, clock, busy, acknowledge

Serial

RS232C compatible, 19-19800 BPS, parity and character bit length at vendor's discretion.

DATAPLUS

EVEN A HARD-working software reviewer has to get away to the club for a pint occasionally. I am no exception. As I waited my turn at the bar, I overheard this fellow talking to an audience of so interested patrons about his life in the Software Secret Service. Let's listen in, shall we?

"In disguise," his story begins, "I become the Software Secret Agent, off on another deadly mission into the hinterlands of softwareland. My top secret equipment includes some of the old standards, a communication test bubble telephonemodem and laser blaster in case of aliens, a ballpoint pen watch/microcassette recorder and standard top secret all purpose milk of human kindness-gundrop pepper.

Top secret

"This mission was commissioned by none other than the CIA, better known as the Citizens against Interactive in Arcadia committee on plots to reinstate adventure as the number one genre in microcomputer gamelands. The nature of the assignment was so secret that the guy who briefed me wasn't allowed to listen.

"It was simple, all I had to do was investigate rumours that Scott Adams of Adventure International USA, who'd launched a fully computerised submarine, had been kidnapped by Biewhard, the notorious international criminal, oil baron, ship-pyng lipcon and litterbug.

"It was true. Investigation revealed Adventure International's new Sea Dragon, the latest twist by arcade genius Wayne Westwood and Terry Garman has been conceived very considerably to the TRS 80 colour computer. I must confess that I am among those who embraced this game enthusiastically. It is all you could ask for in state of the art software.

"See Dragon succeeds where others have failed as far as combining elements of different popular arcade games into a coherent new activity. By going underwater with their company, the dynamic duo of diverse computerisation breed this offering of all but the most oblique similarities to Dandelion, Vanguard, and other comp-butchers.

"Here's how Sea Dragon works. The submarine is launched from shallow water

into a sea of floating mines which (most inconveniently) float up to render her to smithereens. Ah, but she is not without defences. The forward tubes spit out an endless stream of deadly torpedoes which are quite capable of destroying these mines. Chained or unchained they are worth points to the player.

"As the cleverly executed seafloor scrolls under her keel, Sea Dragon makes the journey deep safer for mankind. If this were all there were to the game, the title becomes would have scored a fair hit with me. But, not content to simply be good, they added other elements.

"First of all, air is not unlimited so frequent surfacing is required. Also, the stereomentioned scrolling seabed which makes up the one-way course Sea Dragon must follow is fraught with caves containing silver dollarfish which fall, and can do in unseasoned travellers. And whilst submarine game would be worth its salt without battleships to blow up? Then there are EATs (Enemy Attack Patterns) which fire at random as you pass. Not an altogether safe way to travel, by Sea Dragon, if you ask me. Then there is a reactor (possibly owned by Biewhard, remember him?) which spews radioactive clouds and is protected by a large neutron shield fabricated by a work force recruited from pro-nuclear plague carriers at airports in 70 cities.

"See Dragon's ability to blow things up extends to both the horizontal and vertical plane and allows a lot of room for growth in skill level. Your arcade machines will have to be dragged away from the computer that contains this program. It is a winner, a challenge, an achievement, an achievement and a fair buy for the money — all rolled up into one neatly illustrated package on to which the Adventure International nameless artist has lovingly airbrushed a fine poster quality submarine scene fit for hanging on a computer room wall.

"All this was useful information as I set out to rescue Scott from the clutches of the Quez Evil Villain of the Month, namely Biewhard. I took with me my patented Electromagnetic, Microprocessor equipped, Infra-red Adventure Grandmaster Detector, and a cleverly designed Bad Guy Buster guaranteed to foil any evil plot.

"When I arrived at Biewhard's mansion,

I noticed that the lights were dimming. Was I too late? I raced through the corridors to Biewhard's laboratory. The fiend! He was torturing The Phoenix of Puzzles by making him read back issues of Popular Mechanics Monthly.

"I aimed my Bad Guy Buster squarely at the stalking torturer and fired. But the jets bounced off and melted down my gun. Then he ordered me to drop the BGG or he'd turn up the power and torture poor Scott to death. I hesitated. He reached for a copy of The Psychology of Mind Processing as it relates to preparing reports for Congress. I knew I was beaten. I capitulated. I dropped the BGG and surrendered. 'At last! You beaten me!' Biewhard cried triumphantly.

"But as he opened his mouth and let out a squeal of pure joy, I let him have both barrels of my Milk of Human Kindness Gundrop pepper.

"Oh no! he yelled. 'Oh, yes, Biewhard!' says I. 'From now on you will have to be kind to everyone you meet, no nasty letters, no suddenly deaths, no stirring. The Milk of Human Kindness Gundrops have no antidote.'

"He left the lab a confirmed do-gooder, and the last I saw of him, he was heading for the coast in his Juggo, ready to perform massive-good deeds in the Orient. Another threat to humanity foiled.

Clever capers

"I turned Scott over to the crew of the Sea Dragon for the long voyage back to Canada. 'Who was that caped crusader?' I heard him mutter, obviously still dazed from re-reading the instructions to Fifty Acute Games for your Dragon. I chuckled to myself. A good day's work well done, thought I. And wait until the CIA gets my bill.

"When the agent had finished the story I left and went home to verify his findings about Sea Dragon. I could find no one who could confirm that it would run on the Dragon at press-time but I believe we'll see this and many other fine American colour computer programs translated and released in the UK.

"Mike asked me if I wanted to go for a ride on that submarine. I told him to keep away from that Download switch or I'd have him doing bubble sorts on a Sinclair machine. He has agreed . . . so far. ■

Plugging into Prestel

Prestel explored by Keith and Stephen Brain

PRESTEL is a computer database run by British Telecom which can be accessed via the standard telephone network. Although it has now been in operation for a number of years, and currently contains over a quarter of a million pages of information, it appears that it has not taken off as well as was originally anticipated.

The Prestel database is made up of pages, rather like *Comix* and *Oracle*, which are provided by many different individual organisations. However, a major point of difference from ordinary Teletext is that Prestel is interactive. This means that not only can you view the pages, but you can also actually communicate directly with other users of the system.

Microcomputer Resources has now developed an interface cartridge for the Dragon (price £49.95) containing an intelligent Prestel terminal which allows Dragon owners to join the growing number of micro enthusiasts who access this network. However, to use Prestel you need more than just an interface to your computer. First of all you need a modem which converts the computer signals to ones which can be transmitted via the normal telephone system, and secondly you need to pay British Telecom for the privilege of using the network. The cost of the cheapest variable modem is around £30, whilst current Prestel charges are 15 p per quarter for domestic subscribers and 115 p per quarter for business subscribers, with a further charge of 5p a minute up to 15 p on weekdays and Saturday mornings.

Useful services

Once you have paid these charges, you can call up many Prestel frames without further cost, although you still have to pay for certain pages. Within the Prestel database are some specific areas particularly aimed at microcomputer users. The most well known of these are *Micronet* 880 and *Telefax* 258 which provide information and a commercial teleconference service for a limited number of machines. *Micronet* is the main provider in this field and its service is only available to subscribers who pay a joining fee and an extra £3 per quarter. At present, it is not offering any teleconferencing for the Dragon, although it looks now as if it plans to expand into this area.

The *Micro Resources* Prestel unit is built into a standard small cartridge which simply slots into the normal Dragon cartridge port, and a one-metre flying lead that extends to a five-pin DIN plug which must be connected via a modem to your

telephone. A peek inside the box reveals a 2704 EPROM containing the terminal software, a 6800P Asynchronous Communication Interface Adapter, and the crystal and other minor components.

When you power up with the cartridge in place you are greeted with a start screen which queries the screen format to be set up. This is because, although all the menus and prompts appear on the standard text screen, a 40-column high-resolution text driver is used for actual communication with Prestel. *Graphics PROBE 4* is used and you have a choice of normal or inverse video in black/white (b/w) or black/green combinations.

The Prestel interface for Dragon users

As you may know Prestel frames are normally coloured, but it is not possible to provide this facility on the standard Dragon because of the limitations on colours in the high-resolution display. (Although colour information is ignored for display purposes, frames will still contain colour display information and will appear in colour on a system equipped with a special videocard colour card which may be available later.) Once this choice has been made you pass on to the *MAIN MENU* which displays the available options:

KEY FUNCTION	
1	LOG ON OR OFF
2	TERMINAL
3	SAVE FRAME
4	LOAD FRAME
5	PRINT FRAME
6	DOWN/UP/IN
7	MAILBOX
8	OPERATING SYSTEM

Pressing "8" from the *MAIN MENU* always returns you to *Dragon Basic*, from where you can recall the terminal software with *EVOC*.

To connect to Prestel you select option 1 (*LOG ON OR OFF*) and then option 1 of the submenu (*LOG ON*). Next you must dial one of the Prestel telephone numbers and wait for a continuous high-pitched tone (the carrier). Once this is heard the modem

must be connected on line and the screen prompts followed to display the login frame, which asks for your user identity and password. Provided that these are entered correctly you are now free to explore the contents of Prestel. All communication is carried out using only the numbers 0 to 9 and the characters " (asterisk) and # (hash), and most Prestel frames offer a number of choices from a menu. Once you know your way around the database you can jump straight to any page by keying, for example, "808" for page 800. (To make life easier for the Dragon user, "bottom" can be used in place of " " and "ENTER" in place of #.)

It is simple to save a complete Prestel frame on to a cassette tape with option 3, and to reload this frame into the terminal again with option 4. Prompts and error messages are provided to guide you through this procedure.

Printing

Provision for production of hard copy of Prestel frames is also included on the *PRINT/OPTION MENU*. The text content can be printed out on any standard printer, and if you have an Epson MX or FX series printer, graphics can also be easily dumped.

One of the useful features of Prestel is the ability to send electronic mail to other Prestel users. This has the obvious advantages of being much faster than the old-fashioned methods, not requiring you to find an envelope (let alone a stamp of the correct denomination), and working at any time of the night or day. Of course you are limited to communication with other Prestel users, although the number of these is at last starting to increase as interfaces are appearing for many popular home micros. The *MAILBOX MENU* is simply selected by pressing key 7, and displays a series of options:

KEY FUNCTION	
1	SEND MESSAGE
2	PREPARE MESSAGE
3	SAVE MESSAGE
4	LOAD MESSAGE
5	GOTO MAIN MENU

Messages may be typed directly from the keyboard, but it is better to create and add your message in advance. In this mode the start and end of the available message data are indicated by "<" and ">" which gives you an area of just over 800 characters. The keyboard acts as a normal typewriter, giving lower-case characters unless the *SHIFT* key is held down, and you can move around the field with the cursor keys. *DOWN ARROW*, rather than "ENTER" moves you to the next line and editing is achieved by destructive over-writing of existing text.

Once the message is complete, pressing *SHIFT/UP ARROW* returns you to the *MAILBOX MENU*. Messages can be easily saved to tape, or reloaded from tape with options 3 and 4 as before, whilst option 1 allows you to automatically SEND your prepared message to any other user (if you know their number). Provided that you remember to leave Prestel via the

More Resources' Prestel unit is monochrome only (as don't be fooled by this month's front cover — that's artistic licence)

• **LOG OFF** option: you will be advised of any messages waiting in the mailbox.

Telesoftware promises to be a growth area in the future. After all, what is the point in nudging around the shops trying to find a copy of a new release if you can simply ring up a supplier who can send you the program down the line immediately (but of course charge you for it at the same time). You select the program which you want to **DOWNLOAD** from a menu on the teletext/data pages and then choose the **DOWNLOAD** option on the **MAIN MENU** which specifies the header frame for the file. Once this has been found you are prompted to set up your cassette recorder

and the download proceeds automatically. Each appropriate frame is fetched in turn and then saved (or is tape as an **ASCII** file too if you had used the standard Dragon Basic **CSAVE**). A command.

If all goes well and the frames are received without corruption then you can reload the program from tape with **LOAD** as usual (and also **CSAVE** it again in the normal compressed format). Comprehensive error checking is included in case of corruption during transmission, and the software automatically makes up to three attempts to copy each page. In the event of severe corruption, an error message is displayed, downloading is aborted, and

you are advised to re-call Prestel.

The More Resources' Prestel unit is a very professional product and the well-designed software is easy to use with very clear user-friendly prompts. The only real drawback to it is the monochrome display, but if you are keen on Prestel you should perhaps be thinking about buying a dedicated system instead. It adds yet another layer to the possible uses of your Dragon, at a reasonable price. But at the moment it still leaves you in the old "chicken and egg" situation with regard to telesoftware, as until there is an established core of Dragon Prestel users to support, there will not be any available! ■

A NEW, LOW COST, EDUCATIONAL, MULTI-PURPOSE INTERFACE SYSTEM FOR DATA-ACQUISITION AND PROCESS CONTROL

DESIGNED AND DEVELOPED TO A HIGH PROFESSIONAL STANDARD FOR USE
AT HOME, IN SCHOOLS, COLLEGES, UNIVERSITIES, ETC.

Numerous applications around the home, in the classroom, and laboratory. This unit is capable of doing several jobs at once but is simple to use and understand.

Comes as a complete, easy to assemble kit using only highest quality components, with a large self-written and practical instruction manual. No other external components or batteries are needed.

Learn about the mysteries of microprocessor control, data acquisition and general interfacing techniques in a practical way using modern powerful semiconductor devices.

A selection of basic and machine-code programs are included for the operation of the interface.

Extensive application notes and ideas for further development are also provided.

AVAILABLE MAIL-ORDER ONLY:

PLEASE ALLOW 28 DAYS FOR DELIVERY

PRICE £38.95 (PLUS 50p P&P + VAT)

Technical specifications:

6801 Peripheral Interface Adaptor (PIA), two 8-bit data I/O ports with four handshake lines, full use of six internal data registers.

Analogue-to-Digital Converter (ADC), bipolar 8-bit operation with 12 μ s conversion time, handshake control of data conversion process, adjustable input voltage range (0-5V to 0-10V) 0.4% full-scale resolution.

Digital-to-Analogue Converter (DAC), unipolar and bipolar output modes, 8-bit resolution and internal 2.5 volt precision voltage reference, adjustable buffered analogue output voltage.

16-dot LED array visual display and power indicators.

Electromechanical 28V 3s relay.

ELECTROANALYTICAL TECHNOLOGY,

8 ACCESS ROAD, WEST DERBY,
LIVERPOOL L12 4YN.

NEW — FOR THE
DRAGON USER

Learning to love machine coding

Coming down from high-level languages —
Stuart Sampson gives an insight into the machine coding world . . .

WHY DO PEOPLE insist that machine code is difficult? Why do experts insist that programming should be done in the highest-level language possible? What is machine code anyway? Let's throw some of these problems out the window and tell the Basic user that he has been using a machine code alongside Basic without knowing it.

You don't believe me? Then what sort of high-level language is:
PLAY "00:1555.81084.1" or
VDU (28.181.0.0.0) or even
COLOR 2

A real high-level language should recognise PLAY 0 BBAJON, or at least accept RES. In fact many micro accept Basic instead of numbers to program the microprocessor, but still expect the user to program the peripherals chips via numbers, as in machine code.

Numbering

It is this use of numbers that gives computers, and machine code in particular, the reputation of being difficult. The very use of the term "code" implies an understanding barrier. Say after me "machine language". That's better, at least we can think of French rather than English.

Those who have grown to remember the meaning of the numbers used by Basic have no excuse for not attempting to use machine language. In fact it is less number when you use an assembler — to such an extent you don't even have to remember line numbers, you can point to parts of the program using meaningful labels!

However, you do need to grasp some of the principles of the notorious microprocessor to get it to sing and dance. (I live on 40 legs!) The microprocessor spends much of its time like a Post Office sorter, putting items into pigeon holes. Let's imagine a demonstration model. Prepare a rack of little pigeon holes, open both sides, and a pile of wooden cubes that fit in the holes. For a true model of an 8-bit processor system the rack should be 256 long by 326 high, but a smaller one will serve to illustrate the principles. We will also have a master to write in the cubes any number up to 255.

The numbers written on the cubes are the data, the holes represent memory addresses that the processor can attend to. To make your model more realistic you need to put certain numbered cubes into a few rows of holes, then cover them with a sheet of glass. This represents ROM,

Read Only Memory. You can see the numbers but cannot change the cubes. Other rows must be covered also as there is no usable memory in these areas of the rack. Open holes represent RAM. Your rack is now becoming a memory map.

You now take the part of the processor, let's say for example a Z80. You start at address zero and start reading the numbers. The chances are that this area is under glass, and contains instructions that form the beginning of the operating system. To get going they may tell you to copy some data into RAM. On our model the ROM will inform you of an address to find the data, in terms of two numbered blocks. The numbers tell you the count of columns and rows to get to the first cube carrying the data. You will write these on a notepad, your registers. The instructions will also tell you the address in RAM to copy the data to, and you note this in other registers, and perhaps a count of how much data to transfer. Then you are instructed to move the data. A microprocessor never moves data, it copies it, so you look at the source cube, write the number on a new cube and put it in the destination address, causing anything in that hole to fall out the back.

Of course we assume the destination is RAM, is read-write memory represented by open pigeon holes. If it is not, you cannot get the cube in and must discard it.

We can carry the model further by feeding a board behind the rack (assumed so cubes can fall when displaced). In this board we cut a window and call the area view RAM. As the processor puts cubes into it the user can see the back of the cubes, which carry the character whose ASCII code is the number on the front. We can also give the user lettered cubes which he puts into a pigeon hole representing the keyboard. The processor looks at this to accept the user's input.

This model may seem involved, but it illustrates the principles of memory map-

ping, ROM, RAM, moving by copying, the destruction of data when RAM is written to, what happens if you write to ROM, the fact that not all the map has useful memory, and the action of memory mapped displays. With the model in mind let us think briefly of the hardware.

Hard facts

The processor handles numbers between 0 and 255, hereinafter called bytes, as on/off signals on 8 wires called the Data bus. It also has 16 wires to select an address, called the address bus, and a control bus to send signals for read/write, etc. The term bus is a collection of wires carrying binary signals. Connection to all these can be made via the computer's expansion port, and they go to ROM, RAM, sound generators, VDU chips, etc.

Inside the processor these buses are connected to a vast array of microelectronic, which thankfully can be represented as a small number of blocks in a "programmer's model".

At this point one should realise that all I have said applies to the majority of processors used in personal computers, but once inside the processor one must expect differences. However, there are some common points:

- All processors have a register called a program counter, which is used as a bookmark in the program of instructions. It carries the address of the next instruction to be stored.
- All processors have at least one Accumulator. This is where data is stored before number crunching, and it holds the answer afterwards.
- All processors have at least two more registers that are generally used as a scratch pad or for noting addresses in some form.
- All processors have a stack pointer. This is used to point to an address in an area of memory called a stack. This is an external scratch pad in which data is handled on a Last-In-First-Out basis. I will be explaining the use of this later.
- All processors have a flag or condition code register, which is really a collection of YES/NO memories reflecting the more important aspects of the last operation. The state of these can then be used to affect future events. As all useful programs involve getting the computer to act in response to certain conditions, the use of these flags is at the heart of machine language programming.
- Of course all processors have an ad-

The mutterings of your Dragon

... and teaches you how to understand Dragon talk

SOME OF US humans tend to mutter away while thinking out a problem. Have you ever heard a Dragon doing this? Well, those who claim it uses Welsh haven't got superhuman hearing after all. The Dragon mutters in 6809 machine code.

Sooner or later most of us learn that microcomputers like the Dragon are just a bundle of memory supervised by a microprocessor (CPU), with a keyboard and video system added on so as to humans can interfere with it. In the Dragon the CPU is a 6809C, and this has its particular language for its thoughts. Other micros have 2806, 8080 or other CPUs, each with its own machine language.

"What about Basic?" I hear from the back row. "What about Fortn," I answer. "Or any other high level language for that matter."

Basic speaking

Micros are "taught" these languages, just as we learn our way of translating thoughts into words. The Dragon is taught Basic at birth, by having some of its memory filled with a permanent dictionary, the Basic interpreter in ROM. It can use it forth if you teach it so by loading in a Fortn compiler into RAM. Some business micros have no high level language, all they know what switched data how to read a disk.

Back to Basic, and your Dragon's mutterings. What would you hear when it is running a Basic program?

Let us take an example where you have destroyed an enemy ship in a game and have scored 250 points. You are player 1 and your score is variable \$1. The program may say:

```
500 IF HT = 1 THEN GOTO 505
```

```
680 $1 = $1 + 250: PRINT $1
```

The English gist of the Dragon mutterings will say:

● First line 500: first token is IF: look for this in KEYWORD list: it does feature therefore no syntax error: it is in nth position: look up nth address: goto this routine: expect expression: expression found so no error: look up HT in variable names table: found so no error: first corresponding value: should equal 1: true so search line for THEN or GOTO taken THEN found so no error: read next token: GOTO read: search keyword list:

GOTO found so no error: look for routine address: evaluate 500

● Look for line 600 in program statement table: first character not taken as by L&T routine: Look for \$1 in variable names: found so no error: read character is = so no error: expression follows as no error: look for \$1 in variable names: found so no error: read value: next character is + so evaluate 250 and goto ADD routine: store answer as new value for \$1: look up PRINT in keywords: found so no error: find routine address: is following character a quote?: no, so numeric expression expected: goto evaluation routine: look up \$1 in variable names: found so no error: find cursor position: call decimal conversion routine for first digit: write to screen memory at cursor position and advance one: repeat till number written: read program statements for next line.

"What's all this taken business?" I hear from the back row again. Well, most micros handle data as bytes: machine language is bytes, characters are bytes, numbers are combinations of bytes. A byte is a numerical unit with a value from 0 to 255. In the case of characters, the ASCII code is used which states numbers up to 126, leaving 128 possible values free. When storing a program the Dragon uses its keyword table to recognise Basic words and converts these to tokens of values 128 through 255, which act as shorthand saving space in the program statement table, that is to say your program in RAM.

In spite of this shorthand, the Dragon has to look up what to do every time it sees a keyword, and keeps on checking for errors, so Basic is slow.

Direct talk

What would happen if you could break in on these mutterings and tell the Dragon what to do in its own language? Let's say it:

● Read from workspace 1 (HT): compare with 1: if equal set accumulator to 200 and goto score increase routine.

● Add into accumulator contents of workspace 2 (\$1): store into workspace 2: fetch cursor position: derive decimal digit and store at cursor: advance cursor and repeat till number complete.

This is a lot quicker and shorter because you told the Dragon directly what

to do, it does no taking up, and no error checking, but if you told it wrong, because the consequences.

However, the actual instructions you give are a string of numbers, which have no meaning to the average computer literate mortal, nor to a Vic20 or a TRS-80 Model 3, whereas the Basic version would. It's pure Dragon raster, but there are ways of making it more intelligible.

"What do interceptors, compilers, assemblers and monitors have in common?"

Well, they are machine-code programs to help you write programs, and they are all things the beginner should have no need to be aware of to pursue his programming. Let's look at their uses, advantages and disadvantages.

The Dragon has a Basic interpreter that tells it how to go about executing a lot of Basic statements. It reads them, looks up what to do, informing you of

Several assemblers are available

errors, and executes some standard routines in consequence, without ever learning or improving the program. It is ideal for program development, as you get immediate response from what you do.

If you had a Basic compiler you would have to write your program then compile it before it could be run. The compiler does all the tedious up-front, converting your text into a list of machine-code routines to be executed in order at a later date. It checks for errors and you have to correct them and compile again, until you have a program without any "I can't understand" errors. You might still get "run time" errors, eg division by zero, which might be detected by the run-time supervisory program supplied with the compiler. The compiled program runs faster and more efficiently, but is still limited by the structure of Basic.

Assemblers

Several assemblers can be bought for the Dragon. An assembler accepts assembly language rather than Basic and produces a machine code result. Assembly language is really sugar-coated machine code. Each machine code instruction is expressed as mnemonic, ie a word you can remember more easily than a number. You write them in order, without regard to line numbers as reference points, but by including labels you can show the decoder where to go when it needs to go out of sequence. You can give values to numbers and strings and refer to them by names, but even so your program needs to tell the CPU what to do at the level of simplicity of its own language.

A monitor is your access directly to the memory. You must write numbers into the memory cells directly. You can write machine language or data. A monitor is also needed as a run-time supervisor for testing machine language programs, either entered as numbers or via an assembler. It can diagnose the state of memory and CPU registers after a run, just as you might put STOP in a Basic program, halt it and print out the variables to come a bug.

So we have four levels of programming difficulty, each giving a bit of extra performance: the interpreter being the most accessible; the compiler allowing Basic to execute in machine code form, once debugged; the assembler giving a more accessible way of entering machine code; and the monitor which is needed to test machine code and can accept it in numeric, usually hexadecimal form.

"Hexa-what?" from the back row.

"Hexadecimal is just a way to express a byte in two characters, for four-toed slots which can point on both left and fore feet, or up if we take our socks off and ignore thumbs and big toes. Label your fingers and smaller toes from 0 to 9 and those left over A,B,C,D and F. Now rather than counting up to 16 in two goes, we can reach FF, ie 255 in decimal.

"You said each stage gives extra performance. How does writing on a monitor improve on an assembler?" asks the bright one at the back.

"Not a bit, really, but if you have limited memory in which to keep assembler, monitor, your mnemonic list (called source code) and the machine language (object code), you can't load the big stuff."

"What's the answer then?"

"Well, in hex it's 2A, for those who read English 26, but seriously, it depends on your ambitions. If you are out to write real-time games for the market, I would advocate really getting to grips with machine code and find a monitor with full bells and whistles. There is at least one which accepts mnemonics single and works out displacements, so you get some assembling without playing three-quarters of the free space with source code."

"Where do disassemblers fit in?"

"These help you out of the hexadecimal blues. They can recreate assembly language from object code, but of course they cannot invent the imaginative labels you might have used to find your way round the original. Real cases of hex blues happen when you get used to assemblers and then you have a bug that forces you to examine memory with the monitor."

"Are you seriously recommending learning 6809 code in hexadecimal form?"

"Not outright, but it comes with use if you let it, just as with any foreign language, even Welsh I suppose! I learnt 280 code, and have not got a good grounding in Basic with a little help from a crib or two, and being able to read it off a hex dump display certainly helps in times of trouble. Also writing in hex saves a lot of typing, and you can see much more of it in a screenshot."

Masochism?

"You must be one of those Masochist Macho Machinecodists then, that serious programmers despise when they advocate using the highest level language possible."

"Agreed. Their technique is great for complex business problems. Heavy criticism is a pain when the greatest accomplishment of the title is to multiply two assigned bytes together, and readability counts for a bit. But somebody has to write interpreters, operating systems and the like, and the public the games."

"We're told Basic is an unstructured language, what about machine code?"

"Machine code is as structured as a pile of bricks, but you can build how you like. Structure implies form, ie limits. With machine code you can write small routines, link them into larger ones, and then into a whole, or you can start at the beginning and try to reach the end with as little deviation as possible, it's your choice."

"Try a bit of Dragon muttering, it's worth it."

■ **Instruction decoder and ALU** The latter is responsible for arithmetic and logical operations, coming between the instruction decoder and the accumulators. I use the plural because all processors use a temporary accumulator as well as the main one. The programmer need not worry too much about these last details on his model.

Vital knowledge

What the programmer needs to know to program in a processor's machine language falls into three main parts:

The processor's instruction set, the vocabulary.

The processor's internal memory layout, the registers.

The computer's memory map.

You will also need to know a bit about I/O (input/output) which covers keyboard, joystick, graphics, sound, cassette, etc, most of which form part of the memory map.

The other concept you need to get straight is the use of the byte. A byte is a whole number between 0 and 255, and consists of eight bits, which can be 1 or 0. The byte is the smallest unit of data the computer uses, and can be linked to a figure in a number. Our figures can range from 0 to 9, and to represent larger numbers we use two figures, multiplying the first by 10 and adding the second, and so on with further figures. The computer does this too, but with numbers to the base 256 it needs very few bytes to cope with the biggest numbers we can make. Addresses are just two bytes and range from 0 to 65,535.

In fact we find that for many programs we rarely bother with more than two bytes at a time, particularly in machine language. The byte is very versatile, it can represent many things, such as:

- A binary odd number
- A text character
- A graphics character
- A colour, or even "paper and ink" colours together
- A group of picture elements in bit-mapped graphics
- A graphics point co-ordinate
- A machine language instruction (or part of one)

The operations that can be performed on these bytes are called 8 bit operations. They fall into three main groups:

Copying to transfer — LOAD — Memory to Register, STORE — Register to Memory, TRANSFER — Register to Register (in 280 parlance all are called LOAD)

Single byte operations — INCREMENT, DECREMENT, NEGATE, COMPLEMENT, SHIFT, ROTATE, etc

Two byte operations — ADD, SUBTRACT, AND, OR, EXCLUSIVE OR, COMPARE

Single byte operations can be done on bytes in registers or memory in isolation.

Two byte operations almost always are done with one byte in the accumulator and the other in a memory or, for "80" type processors, in a register. The result is in the second in the accumulator.

All processors can also do 16-bit

What's your best source of information on color computing?

Now you can improve your color computing skills... and it's easy to do. **HOT CoCo** gives you more practical information on the Dragon* than any other publication. Nearly 150 pages a month!

Every issue is packed with exciting new things for you to do. We won't waste your time with filler stories. You'll get instructive columns:

- **Klone's Arcade**—enjoy old-fashioned arcade style games on your computer
- **The Basic Beat**—learn everything you need to program in Basic
- **The Educated Guest**—discover how to use your computer as a teaching tool
- **Doctor ASCII**—get answers to your technical questions
- **Graphically Speaking**—create eye-catching designs that add appeal to your programs

You also get a chosen easy-to-understand article every month. Games... utilities... programming techniques... tutorials... graphics... education... hardware projects. They'll help you expand what you can do. And complete program listings show you how to use what you learn.

That's not all. **HOT CoCo** even gives you money too:

- **Candid reviews** help you make every purchase a sound investment.
- **Informative ads** let you comparison-shop from home.
- **New product announcements** tell you what's available before it reaches the stores.

With all this at your fingertips, your subscription could pay for itself with one wise purchase.

And **HOT CoCo** is risk-free. If you don't like your first issue, just write "cancel" across the invoice and return it to us. You won't owe a thing.

Subscribe to **HOT CoCo** today. Twelve big issues are only \$44.97 (US funds drawn on a US bank). Simply fill out the coupon below and return it right now to **HOT CoCo Subscription Dept.**, P.O. Box 978, Farmingdale, NY 11737, USA.

In addition, though in some it might be confined to deriving addresses, and all can perform some form of 16-bit transfer, albeit as two adjacent bytes.

I have now listed all but one group of operations of the average processor, and you might be excused for wondering what all the fuss is about. In fact you might wonder how such simple operations can result in the marvels your computer performs, particularly when loaded with a machine-code game program. The answer lies partly in the group we have yet to discuss, but the main reason is the endless speed at which the operations are done. Just think that every time your cursor gets to the bottom of the screen scrolls, and the processor has to read every individual character and write it to the line above. Do you perceive it as taking time?

I have said that all programs of any value require the computer to choose a course of action as a result of a previous operation. Normally the processor reads instructions from the program and executes them in order using the program counter (PC) to follow the sequence. Suppose some operation updates the progression of the PC, and loads it with a new value. The next instruction will be read from a different part of the program and a JUMP or BRANCH operation will have occurred.

This may mark the end of a particular sequence or routine, in which case the jump will always happen, but all processors have the ability to perform conditional jumps or branches. When one of these is encountered the progression is only diverted if a particular flag is set or cleared. This of course depends on the result of some past operation.

Flying the flag

There are four flags that form the mainstay of conditional branching, and it is vital to know which are affected by which operations. The simplest is the zero flag. This is set when the result of an operation is zero, and often marks the completion of a sequence of loops, or that a particular condition is met, having compared two bytes and finding they are the same. First this derives the terminology of some processors — "BRANCH IF EQUAL", meaning "if the ZERO flag is set".

The carry flag marks carry or borrow in arithmetic operations, just as we do with our sums. This can be incorporated in the next arithmetic operation or used to control a branch. Carry also holds the bit shovelled off the end by shift operations.

The minus or sign flag reflects the state of bit 7 of the result, which is understood to mean negative if we are dealing in signed arithmetic. Rather than regard a byte as a number between 0 and 255, this notation allows 4 values between -128 and +127, and the upper bit is set for negative numbers.

Unfortunately the minus flag can be misleading, for instance if we add +15 to +125 we get +240. However, the byte representing +240 in normal notation has its upper bit set to 1, and would appear to be negative (-16) in signed arithmetic. To

cope with this, processors have an overflow flag, that warns that the minus flag is lying if it results from a signed arithmetic operation.

Conditional jumps are at the heart of the program structure, and usually harbour the bugs in your program. Either it jumps for the wrong condition, or to the wrong place, sometimes missing a valid instruction altogether treating a self-destructive command. This is where many take their ball home and return to Basic, with its now comforting error messages.

Another variety of jump type instruction involves subroutines. These are jumps that divert to a much used part of the program and expect to return to the main sequence where it left off, usually the very *GO SUB* works in Basic. In order to do this, the address of the next instruction of the sequence has to be stored before the value in the PC is replaced to cause the jump. This is where the stack comes in.

The stack is RAM used as a last dumping ground where data is stored and retrieved on a sequential basis, Last-In-First-Out. It is managed by the stack pointer, which holds an address that automatically points to the most recent data put into the stack. The stack can be likened to a spring-loaded plate dispenser, or life magazine — if you put something in, you have to remove all you put in after it to get it out again.

In the case of subroutines, the jump or call stores the address of resumption, the return address, on the stack. When the subroutine is finished, the return instruction withdraws the return address from the stack and puts it back on the program counter, causing execution of the program where it left off. In many cases you may want to preserve the contents of some other registers from destruction by the subroutine. The stack can be used for this too; you push the register contents into the stack, a store operation under management of the stack pointer. To retrieve them a pop or pull is used (as suits your processor's parlance; some seem to have a stronger spring than others).

We can go a little further before the character of the processors stops us talking generally, and cover addressing modes. These do vary from one processor to another, but there is the effective address, which just means that 16-bit value that spurs out of the address bus when accessing memory. The 6800 uses the programmer's idea of a value, others just use it to select memory. How the EA is derived depends on the addressing mode

of the instruction, and is always derived from register contents directly or indirectly.

The simplest form of "addressing mode" does not involve an EA at all, as it covers operations on or between internal registers of the processor, and is sometimes called implied or inherent. The register identification is implied by the code used for the instruction itself.

The next simplest is the immediate mode. Here the data is built into the program immediately following the instruction code (op-code). No store or single byte operations are allowed in this mode as they would affect the program itself. The EA in this case is derived from the contents of the program counter. Some 16-bit operations can also be immediate.

Extended addressing is where the address rather than the data follows the op-code, so the processor has an extended operation to do.

Some processors take this one stage further, "extended indirect". The data found as above is actually the address to find the data you want. In fact some processors boast indirect versions of other modes as well and life can get very confusing to those without a clear head.

The push/pop/peek operations can be thought of as a special addressing mode, deriving its EA from the stack pointer. It allows data transfer only.

Registering

All processors have some register addressing modes, where the EA comes from a register other than the PC or SP. These are most useful for table and string processing. Most processors have single-register addressing, and a version called indexed addressing where the EA is the register contents modified in some way. The most common is where the op-code is followed by a displacement data which is "added" to the register contents to form the EA. This mode can be used for the screen scroll; the register holds the address of the character to be moved, and it is loaded into the accumulator using the register addressing mode. The character is stored one line higher using the indexed addressing mode with a displacement of minus one line's worth. The register content is then incremented to point to the next character and the process repeated.

We now know something about what the processor can do, and how it knows what to do it. We have both dimensions of the processor's instruction set. We also know that each instruction is pointed as a byte (or sometimes two bytes) in the program, often followed by data, displacement or address, and how the program counter keeps track of progress through the jangle of numbers. But how do we cope with the jangle?

This is not obvious on many home micros, and seems to present another barrier to machine language programming. Often we need to buy extra software just to ignore the Basic interpreter in order to speak to the processor direct (see the accompanying article). It is as bad as a boss surrounded by secretaries telling you he's busy. ■

SPRITES FOR THE DRAGON

Merlin's Sprite Magic offers a whole host of new features for the Dragon

Up to 128 sprites. Size up to 40 x 40 in mode 4, even larger in other modes. Sprite magic uses the 256 x 192 grid for screen addressing. Sprites are programmable for joystick control and/or keyboard control. Sprites may be defined as missiles fired from other sprites in response to fire-button or keyboard. Sprites may be programmed to rebound (like a bouncing ball), or wrap round, or disappear automatically when they get to the edge of the (user defined) screen. A wide range of commands and functions offers comprehensive control of speed, direction, screen edge behaviour and collision detection.

Animation is easily implemented with DRAW function which swaps the drawings being used for sprites and they needn't even be the same size.

Some of the commands are exceptionally powerful. . . . MOVE moves a single sprite, MOVEIN moves a block of sprites, MOVEIN moves all the sprites. All the MOVE commands observe the individual direction, screen-edge, joystick and keyboard instructions for the various sprites. The REPORT function reports how many have crashed. The HIT function reports crashed sprite numbers.

Sprites are non-destructive i.e. they do not leave a "tail". They're fast and they're efficient and they're easy to use.

The Dragon has its very own DEEP command. This one, however, offers a range of 16 pre-programmed gestures, explosions, stars, laser sounds and the like. You can also program your own. . . . DEEP (six parameters) lets you generate the kind of noises you have heard on other high quality software.

Keyboard handling has had some attention too. . . . optional auto-repeat, INKEY function returns ASCII code, KEYF function does the same, but waits for a keypress. CLEAR key clears hi-res screen and homes the print cursor.

We have also included a couple of routines to provide text on the hi-res screen. . . . in all 5 PMODES with enhanced cursor control (providing relative as well as absolute positioning, PAGE command, HOLD command for hi-headers or (graphics), COLOUR command changes text foreground and background colour etc. The hi-res screen is used just like the basic text screen, including editing. You can also re-define the character set using the handy new command CHA(x)=y; eight row values.

Sprite Magic requires absolutely no knowledge of machine code. The comprehensive manual describes the new BASIC commands in full, with lots of examples. As well as the documented demonstration program, the cassette includes Character and Sound Generators. Made in two (yes you said), Shooting Gallery and Breakout. Price £17.25 all inclusive.

MADE IN ENGLAND

Moving up with OS 9

Keith and Steven Brink reveal the ins and outs of OS9

AT LAST! Dragon Data's long-awaited OS9 disk operating system and range of associated software have arrived on the scene as part of a deliberate policy of moving "upward" into the small business and professional sector where Dragon Data sees an expanding user base.

It remains to be seen whether small businesses can be persuaded to part with their hard-earned cash for such business aids, but at the same time the arrival of OS9 is a major step forward for the computer enthusiast who wants to squeeze the most out of his Dragon. Certainly Dragon Data's pricing policy seems to be firmly based on the "pile it high and sell it cheap" axiom on which Tesco was founded, and in comparison with many professional programs for other micro, its software prices seem to offer extremely good value.

A serious system

If Sir Clive hadn't thought of it first (as sweet), we would be tempted to say that this step was a "quantum leap" for the Dragon as it effectively transforms the micro from a sophisticated toy into a very serious machine.

The OS9 operating system is the key to the expansion of the Dragon's potential and to fully understand the significance of this development it is necessary to consider how a computer carries out instructions. In the standard Dragon 32 or 64 the "operating system", which contains the commands understood by the computer, is contained within the Basic ROM. If the Dragon DOS disk system is added further systems routines are included in ROM in the cartridge. All of the routines in these ROMs are actually included in the memory map at all times, whereas with a totally disk-based operating system all of the routines are on disk instead, and these are only loaded into memory as and when required. The immediate advantage of this is that you can have a much more complicated operating system without losing much of your previous RAM.

OS9 is a sophisticated management system which enables you to get much more from your Dragon. As it was designed by Microware Systems Corporation in collaboration with Motorola (the designers of the 6800 CPU), it is an extremely efficient product which uses the capabilities of the 6800 to maximum advantage. A major difference between the 6800 CPU and lesser microprocessors is that it supports "position-independent-code (PIC)" which means that routines can be loaded

and run at any point in memory. Thus the available memory can be used much more efficiently, and several programs can be present simultaneously.

In practice OS9 carries out all of the housekeeping for you automatically without any need for intervention from the user (unless you attempt the impossible). Normally modules are loaded as required and then deleted from memory once their usefulness is ended, but where modules are called repeatedly these can easily be loaded into memory in idle time. A substantial OS9 Operating System User's Guide is included and an OS9 Programmer's Manual (unseen as yet) is listed at £19.95. The details of OS9 are too complex to explain in the small space available here so we will try to give you the flavour of the system and point out what we feel are the most significant features as far as the Dragon implementation is concerned.

To run OS9 you need a Dragon with 64K of RAM and a Dragon DOS disk system. When you use OS9 you turn your Dragon into a 64K "soft machine" and switch out both the standard Basic ROM and Dragon DOS, although you need the latter to set this process in motion. You turn on the Dragon as usual and when the Dragon DOS logo appears insert the OS9 system disk and enter the command "BOOT", which loads the essential control modules into memory and sets up 64K of RAM. These essential routines are concerned with items such as input/output (I/O) management, disk control, keyboard scan, video display, printer and real time clock. At this point you have 64K of memory set free for use.

The "shell" is the part of OS9 which accepts commands from the keyboard and acts as the interface between you and the rest of OS9. Whenever the shell is waiting for an input the "OS9" prompt is shown at the start of the next line. The command line always starts with the name of the program to be run (which can be one of several different types) and once the line is entered the shell searches for this name, first in memory, next in the "allocation directory", and finally in the user's "data directory".

There are many similarities between OS9 and Unix, and perhaps are an important concept. These are descriptions of the route to be followed by a command and are somewhat similar to the "filenames" used by other systems, except that they frequently consist of a list of names rather than just a single name. Multiple devices (file disks) store data in separate files

which have names that are entered in a "directory file". When a new disk is first formatted a "root directory" is created automatically, and sub-directories are formed beneath this in a tree-structured hierarchy.

For example, the root directory of the standard OS9 system disk contains seven files: 0000root, 0000S, 0000F, 0000I, start-up, 0000E and 0000T, and the 0000S directory contains a further series of files which contain the modules for 47 individual OS9 commands. It is sometimes a nuisance to have to specify a complete pathlist to call up a particular file, but this is often unnecessary and only a relatively minor irritation.

The default startup file uses the normal Dragon text display, with upper-case letters only, but both upper and lower-case (mixed) can be called with "-LPC", with or without shift-lock. A number of control functions can be called by codes or via the "clear" key, and a "type-ahead" buffer operates except when the disk drive is running. An alternative video driver producing a 51 column by 24 line true upper and lower case display can be called by "VSDT". However, although preferable, it does eat up 6K of memory.

Modes and codes

Two hi-resolution graphics modes are supported (MODE 3 and 4) and codes are available to produce the equivalents of PMODE, COLOR, PSET, PSEG, PCUR, MOVE, LINE and CIRCLE. But the very useful DRAW, GET and PUT are reliable by their absence. Joystick values can be called via assembly language system calls.

OS9 has a unified I/O system in which transfer of information takes place in the same way regardless of the hardware device involved. This means that I/O can easily be redirected to alternative devices without having to alter the program. (For example to direct output from the screen to the parallel printer port all you need to do is add "xP" to your execution command instead of changing every occurrence of "PRINT" to "PRINTxP"). This also means that programs are highly portable from your Dragon to any other computer using the 6800 CPU. The "ACIOS" module redirects input or output to the serial port, and this can be used, for instance, to drive a serial printer or to transfer data from another device (such as another Dragon). No cassette driver routines are provided.

If more than one program is entered on the same line, separated by semicolons, then these programs will be executed strictly in sequence. The second kind of separator is the ampersand (&) which denotes concurrent execution (two or more programs running simultaneously). Much of the time the CPU is simply waiting for some input and the efficiency of OS9 is much enhanced by "time-sharing" which allows different processes to share CPU time and other resources.

Management is carried out automatically but specific priorities can be applied to different processes if desired. As an ■

4 example entering "GDI=PS" will show a process ID number (for example, 001), start to print out a directory to the printer, but immediately return the QDS prompt so that another command can be entered. The last type of separator (I) sets up "pipelines" between concurrent programs so that the output from one automatically becomes the input for another with perfect synchronization.

Ownership

QDS will support timesharing between a number of terminals and the LOGIN command can also be used on the standard system to check for the correct password before entry is allowed. Every file has ownership and attributes which determine who may access the file and how it may be used. The current user number is automatically added to the file, and execution, reading and writing can be restricted to this user. Finally we must mention the QDSgen and Colorgen commands which allow you to change the system tool configuration to suit particular applications.

Undoubtedly QDS is a very valuable tool, the power of which is well demonstrated in the applications software described below.

Basic DS is described as "an enhanced and structured Basic language programming system specially created for the 6808 advanced microprocessor used by the Dragon computer". In fact Basic DS is rather a Basic/Pascal hybrid with an odd bit of Fortran thrown in for good measure. One very important feature is that it has an interactive compiler which gives it the speed of a compiled language and the ease of use of an interpreted language.

Although Microsoft's Color Basic (the standard Dragon version) is extremely easy to use and is noted for its excellent graphics commands, it was not written for a particular processor whereas Basic DS was especially written to exploit the full potential of the 6808. Basic DS is fully compatible with other programs running under QDS so that you can use it to process files produced with the database package RMS, Stylograph and others.

Basic DS is made up of some 20K of code and an startup disk is returned for workspace, although this is easily changed with MEM up to a maximum of about 24K. On startup it is in SYSTEM mode where

you can interact with QDS and control the workspace environment. Programs are written and entered in GDI mode, the language is fully structured, and programs are written as procedures where line numbers are optional. A syntax check is automatically made at the end of each line and in addition a further error check is performed when the procedure is complete. Provided that no errors are found the program is immediately compiled to intermediate (IT) code which is executed by runtime routines.

When an existing procedure is added it is automatically decompiled and the "line address" of each line is printed out so that the position of errors can be easily located. Program listings are automatically "pretty printed" to show nesting. A wide range of editing commands (including search, change and renumber) are provided. Standard control structures are supported, in addition to WHILE ... DO, REPEAT ... UNTIL, LOOP ... ENDLOOP, IF ... THEN and ON ERROR GOTO are supported.

Programs can be simply RUN by name or AUTOCRUN allows immediate execution after loading. If errors are found then these are dealt with in the comprehensive DEBUG mode. In particular BREAK allows you to set up breakpoints. STEP associates a procedure one source statement at a time, and STATE lists the nesting of all active procedures. TRON turns on trace mode where the compiled code of each equivalent statement line is retransmitted to source statements and displayed before the statement is executed.

The PACK command allows you to further reduce the size and execution time of your program by forcing another compiler pass which removes names, line numbers, non-executable statements and so on. But once the procedure is in this form it cannot be edited, debugged or reloaded into the workspace, although the code can be run from QDS at any time and is secure. Speeded up in the order of 10-30 percent is claimed, but that rather depends on how much unnecessary material there was in the original version.

A Graphics Interface Module (GPM), written in assembly language, is provided to give easier access to the I/O facilities described under QDS itself. In addition to the facilities mentioned previously there

are BLOC (returns the address of the video display RAM, COLOR (-PPCNT) and JOYSTICK (as Color Basic). No sound capabilities are included (Japan from 8011).

QDS has very powerful mathematical functions, and real-decimal-digit, 40-bit, binary floating point arithmetic.

The TIME statement can be used to produce a new user-defined data type which may use the standard data types. As well as the normal Boolean operators (NOT, AND, OR and XOR) bit-by-bit logical operators are provided (LNOT, LAND, LOR and LXOR). Other functions include MOD (remainder), ADDR (memory address of a variable, array, or structure name), SIZE (size of a variable, array, or structure name), QDS (code of the most recent error), DATE (current date and time), and TRIMS (removes trailing spaces from a string). The useful INKEYS command does not appear in the manual (except as an assembly listing) although in fact it is actually present in the QDS directory.

Files and I/O are dealt with in typical unified QDS fashion. INPUT, PRINT, PRINT USING, CREATE, OPEN, CLOSE, DELETE, READ and WRITE are self-explanatory. GET and PUT statements are completely different from their Microsoft pseudonyms and read and write fixed size binary data records to files or devices whilst SEEK changes the file pointer. They are the primary I/O commands for random access and can be used to deal with individual records or whole data structures. As they use the same binary format as the actual disk files they are much faster than READ and WRITE which convert characters to and from ASCII format.

Speed measurement

Although we are not generally greatly in favour of comparing "benchmarks" for different machines, a quick check of the standard (Microsoft) comparisons revealed such a startling improvement over standard Dragon Basic that we could not resist including them.

A quick glance at the comparison table shows what a test board has been added to the Dragon. Even in the worst case (ruling out numbers) the speed improvements are dramatic (execution time reduced to 35 percent). If integer run-

	6801	6802	6803	6804	6805	6806	6807	MEM
MICROSOFT COLOR	1.59	16.76	15.76	21.60	25.59	34.20	50.70	27.12
BASIC85 (REAL)	1.60	11.29	9.20	8.88	7.88	12.50	20.10	7.97
BASIC89 (INTEGER)	6.50	6.50	3.60	2.30	3.50	4.20	5.50	3.16
BBC B	1.60	3.10	3.70	5.70	9.20	12.50	21.50	9.44
COMMODE 64	1.40	10.50	17.20	20.00	21.00	22.50	51.00	24.27
ACT APRICOT	1.50	4.50	16.40	16.20	12.20	22.00	35.50	14.00
IBM PC	1.20	4.50	11.70	12.20	12.40	23.20	37.00	14.56

Benchmarks: standard programs designed to measure the speed of particular processors on different machines

4Cers are used whenever possible (the results are almost unbelievable reduction to only 14 percent of the original time). Comparisons with some other machines are also very interesting and demonstrate that 18 bits are no substitute for good software.

Complete package

The Slogograph word-processing program is only available as a complete package which also includes the Mailmerge and Spellcheck options, but at the total price is only £39.99 you can hardly complain about that. It can be used on a single or dual disk system, but on a single disk system storage space is somewhat limited as the extensive dictionary is on the same disk as the text files. A detailed manual is provided which explains the system quite clearly, and a step-by-step tutorial is also provided. The manual was obviously not written specifically for the Dragon, and unfortunately the tutorial is very confusing in places, as the examples given assume that the default screen display is wider than it actually is. (Slogograph uses a 51 column by 24 row display format but line length can go up to 180 characters and the screen can be scrolled left and right in 25 character steps.)

To use Slogograph, simply replace the OS9 system disk with the Slogograph disk, change the directories to the new disk (ctrl-0/cntrl-0/cntrl-0), move to 51 column mode (go61) and type "slog" to enter "supervisor mode" where a menu of options is provided which are selected with a moving cursor. Text can be loaded and saved, backup files are automatically kept, and accidental deletion of files is difficult as comprehensive error traps are included.

The extensive printing capabilities will support virtually any type of printer (including proportional spacing) and any necessary modifications can be carried out at the time or on a permanent basis by calling the STTRM program. Even when the system is configured for a special printer, supporting underlining or alternate fonts, a straightforward printout can still be produced by selecting the ITT option, and files can also be spooled to disk for later printing. It is possible to PAGE any command to OS9 from within Slogograph, which is particularly useful if you want to call up a disk directory, for example.

Selecting EDIT takes you into the ESCAPE mode where cursor control, scrolls, find, replace, move, duplicate, delete, insert and single character events

can be carried out. A useful card showing the keyboard functions in escape and control modes is provided. The current page number is displayed at the top of the screen, together with a line of dashes to indicate the line length and you can easily jump to any existing page. The cursor control and scroll keys are grouped in the traditional diamond pattern, and hitting the semicolon takes you into INSERT mode, where text can be entered. It is obvious that you are in insert mode as the current line is now indicated with a row of inverted hyphens indicating the line length.

Full page formatting facilities are provided, and the effect of many of the commands is visible immediately on screen. Text may be unjustified, left justified, right justified, or centered and the input buffer and command window of the display mean that it is impossible to "miss" characters even when typing rapidly. Page headers and footers, new paragraphs and pages, margins and indents can be defined.

Control functions can be called from either escape or insert mode, with the "clear" key being used as control. CTRL-A calls assistance if you forget a command; CTRL-G, W and D delete characters, words or lines; R sets tabs; Y clears tabs and Y moves to the next tab position. Five different types of character modifications can be specified (provided that your printer can accept them): underline (U), overline (OL), superscript (H), subscript (N), and boldface (B). These are normally indicated by reverse printing of the text, but they can also be checked by the VIEW command (V), which replaces the text with different numbers according to the modifications called, and all modifications can be removed with Z. CTRL-F allows you to remove the format lines from the screen so that more text can be viewed, and P shows the current status of the text.

CTRL-S allows you to insert "ghost letters" into long words. The first control function (H) allows you to put a name (abbreviation) to any error you may encounter. Hitting the clear and break keys at the same time returns you to the escape mode.

To begin with we found that switching between insert and escape modes was a little tedious, but with practice this was not really a problem. The maximum memory allocation for Slogograph seems to be 416K which only gives a total of 660K bytes for text storage (about six double-spaced A4 pages), which is rather small, but text files can be linked to produce

longer documents. It is a very sophisticated system (the style file alone contains over 21K of code and 6K are needed for the hi-res test display) so there has inevitably been a trade-off between facilities and space.

The Mailmerge option has three functions. First of all it allows you to print any number of copies in a particular file. Secondly it allows you to link files together for printout as a single document with continuous page numbers, headings and so on. Finally it allows you to merge a file of "variables" with a text file. The most obvious variables are names and addresses for personalised circular letters but there are obviously many other applications. As OS9 is multitasking it is easy to set up Mailmerge as a background task which proceeds even as you are preparing another document.

If you can't stand the noise of your printer when you are working then you can simply divert the output to a comprehensive disk file which can be printed later. If you also have the RMS database you can use it to produce a file of specific data to be merged with the text.

Spellcheck

The final part of the package is Spellcheck, a very impressive program which rapidly compares each word in your text file with the contents of its dictionaries and reports any words which it cannot find for possible correction. The standard dictionary contains an amazing 40,000 words (Spellstar has 12,000) which are in a specially compressed format that occupies only a quarter of the space normally required. In addition it is easy to add new words (such as technical terms) to a supplementary dictionary.

If a "non-match" is found then the word is displayed and one of a number of options can be selected. You can simply ignore the word or (Add it to the dictionary. On the other hand, if you are less sure of yourself, you can decide to (Display it in context or (Flag it for later action. In theory it is possible to decompress the dictionary to read the words but the normal Dragon disks are too small to hold the results. More usefully, it is possible to merge supplementary dictionaries into the main one to give more rapid checking of added words. As a sideline a wordcount is also produced during checking.

We hope this introduction gives a taste of what can be done with OS9 — other applications packages will have to wait for a later review. ■

of the hill!

The RAINBOW is the biggest and best magazine available for the TRS-80[®] Color, T104-100, MC-10 and Dragon-32 Computers.

And now wonder! It's over 360 pages thick each month! 12 pages featuring with programs, printed circuitry, tutorials, columns, hints and tips about your computer. Yes, it is considered "the" Color Computer magazine to buy.

Don't delay. For only £28 you can get the Rainbow every month of the year. Then your CoCo will be King of the Hill too!

SHARDS

THE ULTIMATE SECRET?

WHEN you have endured the burning farmhouse and discovered a strange diary, avoided the football hooligans, met the shady lady, Japanese tourists, the pop star and the busker; avoided the gunmen, Eddy the crook and Scarface; visited the waxworks, the natural history museum and the arcade; worked in the street market, the agency or the cafe; travelled through France, Germany, Italy, Turkey and Israel, experiencing Abdul's maze, the labyrinth and meeting a handful of very strange people on the way . . .

ONLY THEN can you be deemed worthy of discovering the ultimate secret. **ALTERNATIVELY** you can play **PETTIGREWS DIARY** on your Dragon, BBC B or Electron, and learn the secret from the safety of your own armchair. **BUT DON'T JUST LISTEN TO US!**

"Pride of place in this supplement for the most original and entertaining adventure . . . it's got to be value for money"

Computer & Video Games adventure supplement

"The best adventure game for the Dragon on the market that I've seen"

Personal Computer News

"I have nothing but praise for this unorthodox adventure"

Micro Adventurer

"If you like puzzles and mysteries you'll like this package"

Computer Choice

PETTIGREWS DIARY is available for only £7.95 from **BOOTS** and all major stockists or by sending a cheque/PO to us at:

Motor Cross

From Fraser Chaddern in Kentman

MOTOR CROSS is a game for one player requiring the utmost in precision and timing. Using the keyboard the player must steer the car around the track without crashing into the sides. The you must do for as long as possible, remembering that the faster you go the higher your score, but also the more you slide.

When the car hits the side of the track one point is added to the damage score and when the damage total reaches eight the game is over. The program uses PEEKs to recognise the key being pressed and therefore if a key is kept down the car will keep turning until the key is released.

The track is set up in lines 480-540 and

so can easily be changed or modified to give a different track. The program includes trial REM statements separating the main sections, all of which can be left out to save time.

Program notes

100-400 Defines 16 positions of car and checks for instructions. Draws and displays track.
480-640 Plays national anthem and resets variables.
650 Goes to appropriate subroutine (see lines 680-880). Increases or decreases score depending on current speed and checks to make sure speed stays within current limits.
680-675 Checks to see if car has turned full 360 degrees, and if so it resets MTO 1.
70 subroutines to plot rela-

tive car position on screen and check for crash.
 Damage routine.
 Crash routine.
 Score routine.
 Keyboard subroutine.
 Instructions.

Variables

Amiga 681-685 and R1-R5, 16 positions of car.
T0 Time.
S,Y Co-ordinates of car.
M Positional positions of car.
SC Current score.
SC Current maximum speed of car.
DM Damage of car.
H Highest score so far.
A Horizontal acceleration of car.
B Vertical acceleration of car (used in sliding).

AT £249.00, THE TAIL'S NOT WAGGING THE DRAGON.

You could pay a lot more for a printer to interface with your Dragon.

But it seems crazy to turn a price with an add-on carrying a price tag running into three or four hundred pounds.

Especially when the revolutionary Seikosha GP2000 does as much for as little.

For example, it's got full graphics capability, with a single command enabling a column of graphic data to be repeated as many times as you need.

Printing speed is 30 characters a second in an 80 column dot matrix format on standard width paper adjust-

able up to 10 inches.

And under its compact casing, the Seikosha packs a wealth of sophisticated features like automatic printing (no data lost due to overflow), intermixing of graphic, character and double-width character modes on a single line and printing of a copy as well as the original.

It all adds up to a quality, reliable add-on that breathes new fire into your Dragon's performance: accounts, cataloguing, lists, charts, diagrams and program debugging are now all available in print.

See the Seikosha GP2000 in action - please for details and the address of your nearest dealer.

SEIKOSHA DRG

DRG Dataflow Systems, Peripheral Division, 10-14 Lane Crescent, Wintonside Rd, Wotton-under-Edge, Avon BS24 9BN.
Telephone: 0934 479114. Telex: 444764.

M & J SOFTWARE "DRAGON SOURCE'S PROGRAMMER'S PACKAGE"

We provide the most comprehensive PC/XT programmer's package available — just compare our specifications with those on other systems packages. You get:

1. The language that which can access basic commands from within PC/XTS program development packages (Dragon's) and can be used to create programs.
2. A 100% complete manual which contains the PC/XTS source code, program, etc.
3. The PC/XTS installation manual which contains the PC/XTS source code, program, etc.
4. A manual containing lots of example programs including the source code for the PC/XTS programmer.

For PC/XTS only!

To complete the package we provide a copy of the "Dragon System". This includes a complete system to be used with the PC/XTS. An extensive Dragon manual, lots of disks of more source code, graphics routines, how to change programs, source code, etc. (MS-DOS 2.00).

all prices include all other Dragon and PC/XTS software

ULTIMATE SOFTWARE

15 Shipland Place, Tiverton, Devon EX16 5EP

ULTIMATE M/C MONITOR £5.95 inclusive

If you only wish to dabble in M/C, you may opt for a cheaper alternative. But if you seriously intend to write and debug M/C then you need ULTIMATE.

COMPACT: fits in just over 3K of RAM
 RELOCATABLE: loads anywhere convenient
 EXCELLENT software interrupt handling

In fact, ULTIMATE has most of the usual (and some unusual) features found in the better M/C monitors. BUT ULTIMATE'S PERFORMANCE IS SUPERIOR.

```

DRAGON 32 OWNERS

Make your Dragon turn into a real computer with the new Double-Density Delta Disk System.

The Delta Disk System Gives You . . .

- An affordable disk system.
- Powerful Delta disk commands.
- Lets you produce and handle random access files as easily as serial files.
- Random sequential and indexed file handling.
- Simple plug into Dragon
- There are no HARDWARE MODES needed to run DELTA!
- Easily expandable 100K to 1.4 megabyte ON LINE storage.
- Full range of business utility and games software AVAILABLE NOW!
- The price you see is the price you pay. NO HIDDEN BMM upgrade costs.
- Uses under 2K of user — BMM as DELTA is held in EPROM.
- Enables programmer to easily produce applications Software which automatically starts up and operates without any intervention from the user.

DELTA CARTRIDGE — contains DELTA disk Operating System, User Manual, demonstration software . . .	\$120.00
DELTA 1 — DELTA Cartridge, User Manual, single-sided 40 track (700K) drive floppy	\$120.00
DELTA 2 — as DELTA 1, but with a single-sided 80-track (1400K) drive	\$150.00
Disk Interface cable (supplied with DELTA 1 or 2)	\$7.95
DISCOOL EP assembler/disassembler/editor — Integral with DELTA	\$24.95
ROMS ACCOUNTS full home package for DELTA	\$14.95
MSOOL — Data Base Management System commissioned especially for DELTA systems	\$24.95

FLEX FOR THE DRAGON USING DELTA

NEW

FLEX is an internationally accepted Disk Operating System. It features dynamic file allocation, random and sequential file handling, selective file capability, auto drive searching, file dating, space compression, user environment control, error messages in English and over 20 commands for disk operation. A large number of high quality software packages are available to run under FLEX ranging from spreadsheets to word processors, compilers to new languages. FLEX is an elegant, friendly and efficient disk based operating system. FLEX is available now for the 54K DRAGON using PREMIER's DELTA disk system. It is supplied complete with a 200 page manual. An editor and assembler are both supplied with the package.

FLEX is the registered trade mark of Technical Systems Incorporated. DRG-25 Inc. VAT and P&P.

NEW

DOODLE MASTER

- PREMIER'S DOODLE MASTER provides the DRAGON 32 graphics programmer with comprehensive facilities for the definition of graphic shapes.
- Create high quality graphic elements which can be used in BASIC, or MICRO-COOL programs
 - Fully compatible with DISCOOL EP
 - Shapes can be generated and edited many times faster
 - A DODLE facility allows the user to generate a series of program lines containing BASIC or MICRO-COOL statements representing the different shapes, which automatically repeat themselves to the screen program in memory
 - Shape data can be saved to cassette or disk
 - A LINK facility allows shapes to be joined together either vertically or horizontally
 - A PREVIEW editor function allows the user to examine the generated shapes in another MICRO-COOL mode

File: Cartridge £17.95 DELTA 1/2 £16.95

TOOLKIT FOR DRAGON 32

PREMIER'S ADVANCE NEW TOOLKIT FOR THE DRAGON 32 PERFORMS THE FOLLOWING ASSIGNED FUNCTIONS:

- Full screen editor allowing editing
 - Input PROGRAMABLE KEYS
 - Shift editor for modifying graphic screens
 - Full range of DRAGON commands compatible with several MICRO-COOL systems
 - OVER SIXTY NEW WORDS fully loaded to your DISCOOL BASIC
 - VARIABLE COLOR-COOL commands
 - Superb BACK command which sets top right of screen only, then copying graphics text word
 - SEARCH and REPLACE commands for screen program modification
 - Comes complete with COMPREHENSIVE 200 page MANUAL
- Available in CARTRIDGE or DELTA enhancement format £29.95 inc.

Capacity: 1000mAh
Order in this package (also
see instructions for use)
Price: £14.95 per full package
plus delivery and postage

Memory address

I WOULD like to know the port memory address for use with a portcable and light pen on a Dragon 32K.

David Morgan,
Farnley,
Riverside.

THE joystick/light pen sockets are wired to the Dragon's D/A converter which is addressed at location \$F020. However, to read values from this address involves a lot of tedious playing around selecting which socket you want to address, and thankfully there is a ROM routine to do it for us.

The values from the four inputs are stored as a number between 0-15 in locations \$48 to \$4B. The values can be updated at any time by using the machine language command `JBR $4848`, or in Basic using `GOTO 4848`.

As the same D/A converter is used for sound output, you cannot mix sound or have the sound channel open when reading the ports.

Basic converter

I WOULD like to know whether there is a computer for the Dragon 32, which could convert Basic language straight into machine code.

D. A. Duffield,
Preston,
Surrey.

THESE 32 such a compiler available for the Dragon 32 from Quark Software. The compiler will handle sound and graphics as well as POP-NOCT input, arrays, strings, etc. It can also compile programs straight from tape.

The compiler costs £74.95 and is available from Quark Software, c/o Alexandra Parade, Weston-super-Mare, and the telephone number is (0834) 876621.

Out of the maze

ON THE last screen I have constructed the plan view of a maze in string arrays consisting of

ASCII CHR 128, and move a CHR around using the arrow keys.

The problem is, how do I detect when the moving CHR is accidentally moved out of the maze?

If the CHR is moved out I also want to print a message when this happens.

R Collinson,
Spotswood,
Dorset.

THE easiest way to do this is to POKE the screen memory. If the character you are moving around is stored as CHR4, and the current position on the screen is x,y, then a simple program line such as:

```
100 IF POKE (1024+(X-1)*256+Y)<>128 AND  
POKE(1024+(X-1)*256+Y)<>CHR4  
THEN ... out of maze routine  
will detect whether the player has attempted to leave the maze.
```

Defender games

I HAVE owned a Dragon 32 computer for some time now. In my searches of magazines and software dealers, I have, as yet, been unable to find a Defender game for my computer.

Do you know of any such game, and if so, where can I obtain a copy, and for how much?

Stephen Le Munte,
Cambridge,
Cornwall.

THESE ARE a number of Defender type games on the market for the Dragon. One of the most recent additions I have seen is called Planet Invaders by Microcad.

This costs £5 and should be available at stores such as Boots

or direct from Microcad at 41 Friars Road, St Austell, Cornwall PL25 5AB. The game requires a joystick to play and has colour or black and white options.

Code accessing

COULD you please tell me if it is possible to access any of the machine code routines in Rom for hi-res graphics directly from a machine code program? If so how?

A Jordan,
King's Heath,
Birmingham.

LISTED below are the machine code entry addresses for all of the world graphics commands. Before using any of them you must set up location 100/101 to point to the correct ASCII character, possibly held in a table within your m's program.

For example, if you wanted to use PRESET, you would set up loc 100 to point to "y,y" where x and y are the graphics coordinates you wish to use, and then use `JBR $2738`.

```
LINE = $2635  
PSET = $2735  
SCREEN = $3010  
CIRCLE = $3020  
PMOVE = $3030  
PCLS = $3280  
PRESET = $2738  
COLOR = $3273  
PSET = $4157  
DRAW = $5137
```

POKE speeds

IT'S PROBABLY already been answered but ... Why doesn't the widely publicised POKE \$A000.0 and its alter ego, POKE

\$A000.0 work on my Dragon 32 May 1983?

It is this method of spending up my programs, they instantly crash. Presumably something has been changed, so is there an alternative location for newer Dragons? I remain stuck on 0.9 megahertz.

Mike Ashburn,
Ashbur Regens,
Swindon.

YOU'RE QUITE right, this question has already been answered, but it keeps turning up time and time again and so is worth repetition. The command `POKE $A000.0` (and \$A001) instructs the SAM chip to address ROM at double speed (3.0 Mhz), hence the Basic runs faster - note that user machine code doesn't run faster as this is in ROM. The 6800 processor at the heart of the Dragon is only supplied to run at normal speed. Come with, however, tolerate the double speed - these Dragons are the exception, not the norm and there is nothing wrong with your Dragon.

Unfortunately, there is nothing you can do short of replacing the 6800 chip and maybe others with ones at a higher specification (which I don't recommend). In any case, Dragon 32K does not recommend the use of the high speed POKE.

Assembly language

I HAVE bought a copy of Programming the 6805 by floodgate Zaks and William Labak, to learn assembly language on my Dragon. Which assembler for sale under £10 do you think would be best to use with my book, and how can I purchase it?

Peter Burge,
Farnham,
Shelton.

DRAGON DATA offers a very good assembler/compiler for £10.95 called Dream (can be LJ 8015). This comes on cassette and on some RAM disk.

If you prefer a cartridge version this is available, called All Dream which also includes a disassembler. This costs £24.95 (not 17 000!) and although it is more expensive, it is probably a better investment. Both should be available from most Dragon software dealers including Boots.

100

that any computer that allows a big box education game which promotes spelling, directional sense, memory and vocabulary. Games of difficulty and appeal within the genre is too played by more than a small number of adults. But RMA statements is only correct.

Competition Corner

Answers to Competition Corner,
Dragon User, 12/13 Little Magazine
Street, London WC2R 2JD

WITH ALL FOCUS DAY nearly on us again, it is perhaps appropriate to look at some of the ways in which mathematicians have attempted to fool each other over the years. In each case, however the problem may appear very complicated, there is, in fact, a simple method of finding the answer.

1. Bill and Ben start out simultaneously from opposite ends of a straight 10-mile-long road, walking towards each other. Bill walking at two miles an hour and Ben walking at three miles an hour. At the same time as the men set off, Bill's dog runs on ahead until he meets Ben. He then turns and runs back to Bill. This procedure is repeated, with the dog zig-zagging backwards and forwards between the two men until they finally meet. If the dog runs at ten miles an hour — and no time is lost in changing direction — how far does he run in all?

2. At 12 noon the hands of a clock lie on a single line. When will they next be precisely superimposed?

3. The secretary of the Middlecombe Chess Club was trying to arrange the fixture list for the annual knockout championships. There were 37 entrants, who were to be paired, the winner of each game going forward to the next round, until only one player remains as champion. The secretary knew that there would have to be a number of byes, but how many matches

Win a printer from DRG

Answer Gordon Lee to win
DRG Business Systems' prize

In all, would need to be played?

4. I have a three-inch cube of wood. By making six cuts with a saw I can cut the block into 27 smaller one-inch cubes. However, is it possible to complete this task with a fewer number of cuts if I am allowed to rearrange the pieces before each cut? Now for the answers:

1. I hope that you didn't work this out by a series of decreasing distances! Bill and Ben are approaching each other at a combined speed of 5 mph. Therefore they will meet in two hours. As the dog runs at 10 mph, it will run a total distance of 20 miles in the time.

2. In the 12 hours from noon to midnight, the hands are one above the other 11 times. As both hands move at constant speeds, they coincide every $\frac{12}{11}$ hours. Thus, after noon, they will next coincide at

1.05 and 27th seconds.

3. The easiest way to answer this problem is to realise that every game will eliminate one player. Therefore if there are 37 competitors, all but one of the players will need to be eliminated, and to do this 36 games will need to be played.

4. It is impossible to reduce the number of cuts by rearranging the pieces. Cutting a block in the manner described will produce 27 smaller cubes, of which one will be located in the very centre of the larger cube. This one cube will have all six of its faces newly cut — therefore needing the minimum of six cuts.

This month's competitive question is also concerned with cutting cubes of wood. I have a number of large cubes of wood, each a different size but each an exact number of inches along the side. I wish to make a quantity of toy blocks for the school basket by cutting away large blocks into one-inch cubes.

Unfortunately, the large blocks have been painted on all surfaces. So I find that, after I have completed sawing, I have some blocks with at least one face painted, the rest having all six faces newly seen. In fact, there are equal numbers of painted and unpainted cubes. What is the smallest number of small cubes that I could possibly have, and state also the number and sizes of the original large cubes?

Prize

A PRINTER will not only enhance your programming skills but also add to the range of things you can do with your Dragon — and this month DRG Business Systems gives you the chance to win one of the latest Spoltzko models.

The printer in question is the Spoltzko SP500A, worth nearly £250. This model prints at 80 characters a second in an 80-column dot matrix format on paper up to 10 inches wide. Features include intermixing of graphic, character and double width character modes on a single line, printing a copy as well as the original, and a single command enabling a column of graphic data to be repeated as many times as you need.

Rules

TO WIN the Spoltzko printer you have to send in the most elegant solution to the puzzle. You must show both the answer to the competition and how to solve it with the use of a Basic program developed on your Dragon. As a bonus, complete the following sentence in 15 words or less: "I want to add a printer to my Dragon because..."

Your entry must arrive at Dragon User by the last working day in April. The name of the winner, and the solution to the puzzle, will be published in our July issue. You may only enter the competition once. Entries will not be acknowledged and we cannot enter into corres-

pondence discussing the result.

January winner

FIRST OF ALL you had to find all five-digit squares in which the third and fourth digits are alike, all other digits being different. This is to correspond to the word "HAPPY". This can be done easily with a program that checks the squares of these numbers from 100 to 316. By putting the square into a string the duplication can be tested for. This results in just 18 possible values. Now, there are just 13 three-digit squares with all digits different, so each possible five-digit square should be matched against the three-digit squares.

Only three pairs that do not contain a common digit are possible because there are no letters common to both HAPPY and NEW. For example, the lowest number which could stand for HAPPY is 12984, so only those three-digit squares which do not contain a 1, 2, 8 or 9 can be considered. Thus, only the square 784 would be a possibility.

Some of the five-digit squares can be totally eliminated. For instance, 24326 is not possible as there is no three-digit square that does not contain at least one of these digits. Some squares, such as 62051, have more than one possible pair. This number can be paired with 289, 529, 729 or 761.

All possible pairs should be listed for values of "HAPPY" and "NEW". We now have to find a value for the word

"YEAR" that is to be prime. But, you will notice that the three digits represented by the letters Y, E and A are already determined as they all appear in the other two words. So, taking as an example the pair HAPPY = 12984 and NEW = 784, the prime represented by YEAR must begin with the digits 982. The first digit can only be a digit which doesn't already appear in this list. A simple program can be devised to test for primes, and from this it can be found that only 9823 is prime.

If this procedure is continued down the list all possibilities except for seven can be eliminated. However, we are told that the professor indicated the value of this last digit R, in order that the problem could be solved. If we look at the list of seven possibilities, there are four instances where the first digit is a 3, two instances where it is a 7, and one instance where it is a 9. Therefore, only if it was this last case that the professor gave us the value for R would a unique solution be possible. Therefore the solution is: HAPPY = 12984 (1184), NEW = 784 (289), YEAR = 9823.

James MacDonald of Luton was one of the many to find the correct answer. His writing fellow-traveler suggested that Colin was the right name for a small business computer (we'll let you know if Dragon Data takes him up on that). James will be receiving the prize donated by Dragon Data itself — a total of 20 software packages.

St. George now has two choices!

Red or green will slay the Dragon

- ▲ Nylon encased-Steel shafted joystick with ball and socket joint.
- ▲ Fast sprung return to centre.
- ▲ Graphite wiper linear potentiometers.
- ▲ 12 Months Guarantee.
- ▲ 7 day Money back Guarantee.

Complete control at your fingertips

The smooth control of the Voltmace delta sprung return joystick is now available to Dragon owners. Each joystick has been individually tested before it leaves our factory, following extensive robot testing to prove the design (we tested it more than a million times). This means that not only will your joystick be strong, tough and reliable, but it also has long life, accurate control and with the choice of red or green fine buttons, gives instant recognition between the left and right joysticks.

If you are not completely satisfied with the delta 3d, return it to us within seven days for a full refund.
